

Control

Idan Landau

Department of Linguistics, Tel Aviv University
idanlan@tauex.tau.ac.il

Abstract

This Elements presents the major findings and theoretical advances in the area of Control. We describe the different types of control (complement, adjunct, obligatory, nonobligatory) and illustrate their profiles in several languages. It is shown that while certain features of Obligatory Control (OC) are common – nullness of PRO, nonfinite complements – they are not universal, hence should not enter its core definition. Comparing approaches to the choice of controller based on lexical meaning postulates with those based on embedding of speech acts, we conclude that the latter provide deeper insights into the core properties of OC. The fundamental semantic distinction between clauses denoting a property and those denoting a proposition proves to be important: It affects both the possibility of Partial Control in complements and the possibility of Non Obligatory Control in adjuncts. These insights are integrated in the Two-Tiered Theory of Control, laid out in the final sections.

1. Introduction

The syntax and interpretation of subordinate nonfinite clauses have been a topic of analysis from the earliest works of generative grammar. Sentences involving what we call today control (the term is due to Postal 1970) have figured in the earliest works of generative grammar (see Chomsky 1955:246-250, Chomsky 1965:22-24). The reason was that they illustrate a curious mismatch between form and meaning, a fundamental concern of the discipline from the outset: A single noun phrase in the matrix clause appears to be semantically associated both with the matrix predicate and with the embedded predicate.

To illustrate, the single NP *Tom* in (1a) is associated with the semantic role of “wanter” (subject of the main clause) and the agent of *finish* (subject of subordinate clause). Likewise in (1b), *Tom* is associated with the semantic role of the addressee of *tell* and the agent of *finish*.

- (1) a. Tom wanted to finish the job.
b. Helen told Tom to finish the job.

There is clear evidence that the NP *Tom* occurs in the main clause in (1a-b). Thus, its semantic relation to the main verbs *want* and *tell* is unproblematic. But how can it be related to the embedded verb *finish*? A key idea has been that this relation is indirect. It is not *Tom* that is related to *finish*, but an “invisible” (null) NP, serving as the subject of the subordinate clause. To be maximally neutral about the nature of this null subject, we can notate it as Δ . It is customary to label these constructions according to the grammatical function of the matrix argument chosen as the antecedent of the embedded subject: *Subject control* in (2a), *object control* in (2b).

- (2) a. Tom_i wanted [Δ_i to finish the job]. *Subject control*
b. Helen told Tom_i [Δ_i to finish the job]. *Object control*

How is Δ related to Tom? Intuitively, Δ refers to Tom; this coreference is represented as coindexing. But how is this relation established in the grammar? This is the fundamental question of control, the relation holding between the controller (*Tom*) and the controllee (Δ).

Throughout the years, this analysis has split into a number of more specific research questions, each generating a large body of scholarship.¹

¹ Control has been extensively studied within Categorical Grammar, Lexical Functional Grammar, Head-Driven Phrase-Structure Grammar, Government and Binding, Minimalism, Formal Semantics and Cognitive Grammar. A single Elements cannot hope to cover the vastness of this literature, so my present goal is rather modest: Discuss the major approaches to control, grouped into a few super-categories, and show how they inform and lead to our current understanding of control phenomena. For previous surveys on the topic of control, covering much of its history, see Davies and Dubinsky 2004, Stiebels 2007, 2015, Kirby et al. 2010, Landau 2013, Polinsky 2013 and Potsdam and Haddad 2017. The most extensive work to date is Landau 2013, whose footsteps I follow below.

(3) Fundamental questions of control theory

a. What is the nature of the controlled category?

Is it a semantic variable, a θ -role, a null pronoun/reflexive, or a copy?
In section 3.1 I will discuss evidence for a syntactic answer – the controllee is a kind of a null pronoun (often labeled “PRO”).

b. What is the nature of the relation between the controller and the controllee?

Is it syntactic, lexical-semantic, pragmatic, or a combination thereof?
Section 3 surveys three families of theories that approach the answer from these three angles.

c. How is the controller determined?

By lexical entailments, by syntactic locality, by principles of speech acts or by logophoric prominence? Partial answers to this hard question will be offered in sections 3.2 and 3.3.

By assumption, PRO functions as a standard subject in the complement clause. Indeed, PRO is fully active syntactically, as documented in Landau 2013:chapter 3: It binds anaphors, saturates secondary predicates, triggers agreement and bears case (on case-marked PRO, see Landau 2006, 2008, Bobaljik and Landau 2009), in ways which implicit, nonsyntactic arguments cannot. These findings already limit potential answers to question (3a) insofar as they rule out a purely lexical/semantic conception of the controllee. However, they leave open the possibility of an *overt* controllee, alternating with PRO or even taking its place (see section 3.1).

The theory to be articulated in this Elements is the Two-Tiered theory of Control (TTC; Landau 2015, 2018, 2020, 2021a,b). This theory, presented in section 5, builds on insights gathered from many previous studies, which are grouped into three main families in section 3. The discussion of these precursors will serve to map out the empirical terrain in which the TTC should be grounded as well as the theoretical demands it should respond to. At its barest, the TTC claims that control is obtained in two different ways: Predication and logophoric antecedence. PRO is always a λ -abstractor, turning the complement into a predicate. In predicative control, this predicate is directly applied to the controller DP. In logophoric control, it applies to a null nominal at the left periphery of the complement, which is related to the controller DP by the doxastic counterpart relation (“*de se* counterpart”; Chierchia 1990, Anand 2006, Pearson 2013, 2016). These two routes of control are instantiated in complements of different predicates as well as in adjuncts; each gives rise to a distinct empirical profile, accounting for many puzzling (and seemingly contradictory) properties documented in previous literature. Furthermore, the notion of logophoric antecedence extends to Non-Obligatory Control (NOC) as well, as discussed in section 4.

The structure of this Elements is as follows. Section 2 characterizes the key concept of Obligatory Control (OC) by highlighting its differences from both standard pronominal anaphora and from Raising. Section 3 discusses three families of theories of control: Syntactic theories, lexical-semantic theories and embedded speech act theories. The classification is mainly heuristic, indicating which component of grammar is deemed

the most relevant for establishing the control dependency. Section 4 discusses Non-Obligatory Control (NOC), a category that turns out to be richer and more varied than traditionally assumed. Section 5 lays out the Two-Tiered Theory of control, synthesized from Landau’s recent works, and spells out its application to complements and adjuncts. Section 6 concludes with a list of lingering challenges for future research.

2. The essence of obligatory control

OC is a referential dependency, but referential dependencies come in many different cloaks. A useful method of pinning down the essence of OC is to highlight the unique properties that set it apart from other referential dependencies. In section 2.1 I discuss the OC signature, which distinguishes OC from standard pronominal anaphora. In section 2.2 I discuss the main differences between OC and Raising. Together, these two sections characterize the notion of OC as understood and used in current research.

2.1 The OC signature

Before any meaningful investigation of a grammatical construction can be carried out, one must delineate the class of phenomena that fall under this construction. Such “working definitions” are heuristic in nature. As knowledge accumulates, and as more languages enter the data pool, the working definitions change to reflect our better understanding of what is essential to the grammatical construction of interest and what is merely coincidental to it. In linguistic research, in fact, it is expected that later incarnations of the definitions will be sparser and more abstract than earlier ones. Typically, notions like linear order, overtiness etc., initially taken to be essential, are subsequently discarded in view of crosslinguistic variability, and commonalities are gradually discerned at deeper levels.²

This has also been the fate of the notion of OC, first introduced in Williams 1980, which has undergone considerable revisions ever since.³ As a starting point for current research, I will adopt *The OC Signature* of Landau 2013, slightly adjusted to reflect some recent findings in the field.

(4) *The OC signature*

In a construction [... X_i ... [S Y_i ...] ...], where Y is the subject of clause S, if:

- a. X must be (a) co-dependent(s) of S, AND
- b. Y (or part of it) must be interpreted as a bound variable

then this is an *Obligatory Control* construction (X=controller, Y=controllee)

In (4), the controller and controllee are neutrally labeled X and Y, rather than DP and PRO, respectively. This is meant to allow implicit controllers, which do not surface as overt DPs, and also to allow controllees which surface as overt pronouns rather than as a null category (see section 3.1). A “dependent” of S is either an argument or an adjunct of S; thus (4a) subsumes both complement OC, where the controller and S are co-arguments, and adjunct OC (on the latter, see section 5.2). (4a) does not require the controller to be unique, thus allowing both control shift and split control, as long as the

² For a recent survey of the rich crosslinguistic terrain of OC, see Landau 2024.

³ See Landau 2013:34-38 for past criteria for OC that were found to be spurious.

two potential controllers are co-dependents (in effect, co-arguments) of *S*. Finally, the parentheses in (4b) are meant to allow partial control (see section 3.1).

To illustrate with familiar examples, consider the following contrast.

- (5) a. Venessa_i was impressed that Mike_j had tried [PRO_{j/*i} to regain his/*her composure]. OC
 b. Venessa_i was impressed that Mike_j had understood that [PRO_{i/j} regaining his/her composure] was essential to the discussion. NOC

Suppose that the examples in (5) are not drawn from English but from some understudied language, and your goal as a linguist is to identify their nature with respect to control. Based on informant judgments, you observe that in (5a), *Venessa* and the bracketed clause are not co-dependents, and control fails; whereas in (5b), both *Venessa* and *Mike* are not co-dependents of the bracketed clause, and control goes through with either of them. This indicates that (5a) abides by criterion (4a) and hence stands a good chance of instantiating OC, while (5b) violates this criterion and so must be NOC. To strengthen this conclusion, you can apply criterion (4b).

- (6) a. Only Mike tried to regain his composure.
 b. Only Mike understood that regaining his composure was essential to the discussion.

Imagine that Venessa and Bob also tried to bring it about that Mike regain his composure. In this situation, (6a) is still true, because PRO must be understood as a bound variable, and Mike is the only individual of whom the property $\lambda x. \text{try}(x, \text{regain-composure}(x))$ holds. Hence, the complement of *try* passes the second criterion of OC (4b) too. Imagine next that Venessa and Bob also understood that Mike's regaining his composure was essential to the discussion. On this scenario, (6b) has a false reading; namely, the reading that ascribes to Mike the property $\lambda x. \text{understood}(x, \text{essential-to-discussion}(\text{regaining-composure}(\text{Mike})))$. The sentence is false because the PRO subject of the gerund *regaining his composure* is understood referentially (as *Mike*) and not as a bound variable; not only did Mike reach the relevant understanding concerning Mike, but so did Venessa and Bob. This indicates that the subject gerund in (6b) falls under NOC also with respect to criterion (4b).

The criteria in (4) are particularly useful in distinguishing OC from pronominal anaphora. Pronouns, including null pronouns, often take intrasentential antecedents, but the relation between the antecedent and the pronoun is looser than the one required by the OC signature. Nevertheless, there is one construction which is famously similar to OC, and which the criteria in (4) are too coarse to distinguish from OC: That is Raising. We now turn to the OC-Raising distinction.

2.2 OC vs. Raising

In Raising constructions, a nominal that is thematically an argument of the embedded predicate appears in the matrix clause, due to A-movement. The raising predicate itself assigns no θ -role to the raised nominal; that is why nonthematic arguments (expletives and idiom chunks) can appear in raising but not in control constructions. An expletive

cannot get any θ -role, being nonreferential. An idiom chunk must be interpreted within the idiomatic phrase. If separated from the idiomatic phrase by movement (= raising), the idiom chunk is still interpretable in its base copy. In control, however, there is no copy of the controller inside the complement clause, hence the idiom chunk is forced to be interpreted as an argument of the control predicate, leading to the loss of the idiomatic reading and often to anomalous interpretations.

(7a,b) show the compatibility of raising-to-subject predicates with expletives and idiom chunks, while (7c,d) show the incompatibility of subject control predicates with these elements. (8a,b) vs. (8c,d) show the parallel contrast between raising-to-object and object control predicates (see (2a-b) for the distinction between subject- and object-control).⁴

- (7) a. It seems that John is happy.
 b. My leg appeared to have been pulled.
 c. * It hoped that John is happy.
 d. * My leg attempted to be pulled.
- (8) a. We expect it to be snowing all weekend.
 b. The police prevented tabs from being kept on their informer.
 c. * We convinced it to be snowing all weekend.
 d. * The police dissuaded tabs from being kept on their informer.

As noted, these differences reflect different syntactic derivations, corresponding to movement in the case of raising as opposed to referential antecedence in the case of control. The raised nominal starts out in the embedded Spec,TP and raises to the matrix Spec,TP (in Raising-to-Subject) or the matrix Spec,VP (in Raising-to-Object), see (9a-b). The controlled nominal, namely PRO, occupies the embedded Spec,TP position, see (9c-d).

- | | | | |
|-----|----|---|----------------|
| (9) | a. | Bill _i appeared [TP Bill_i to feel better]. | <i>Raising</i> |
| | b. | They expected _k [VP Bill _i t _k [TP Bill_i to remain silent]]. | <i>Raising</i> |
| | c. | Bill _i hoped [CP [TP PRO _i to feel better]]. | <i>Control</i> |
| | d. | They convinced Bill [CP [TP PRO _i to remain silent]]. | <i>Control</i> |

Accordingly, Raising and OC display a wide array of empirical contrasts beyond the familiar ones in (7)-(8).⁵ These contrasts can be grouped into three categories. (i) Low thematic source: The raised nominal receives its θ -role in the lower clause whereas the controller nominal receives its θ -role in the matrix clause; (ii) “Reconstruction”: A raised nominal can take scope, or be bound, in its embedded copy position whereas a controller nominal is necessarily interpreted in the matrix clause; (iii) Derivational history: The raised nominal displays properties of a copy in a movement chain whereas the controller nominal does not.

Starting with (i), this is the source of the contrast in the tolerance to nonthematic arguments in (7)-(8). It is also the reason why lexical (“quirky”) case assigned in the lower clause is preserved on a raised nominal but not on a controller. Quirky case can

⁴ With verbs like *prevent*, *stop* and *keep*, Raising-to-Object has an overt effect on word order, shifting the embedded subject to the left of *from*, which is likely a negative complementizer (Postal 1974, Postal and Pullum 1988, Landau 2002, Baltin 2009).

⁵ For extensive comparisons, see Davies and Dubinsky 2004, Kirby et al. 2010, Landau 2013:8-18, Polinsky 2013.

be seen as a morphological reflection of θ -assignment, hence its preservation in raising indicates the low thematic source of the raised nominal. A minimal pair in Icelandic, taken from Sigurðsson 2008, is shown in (10) (see also Thráinsson 1979, Bobaljik and Landau 2009). The embedded passive verb ‘helped’ assigns quirky DAT to its subject. This case lodges on PRO in the control complement (10a) and is *not* passed on to the controller DP (which is NOM). In contrast, the quirky DAT case moves along with the raised nominal in Raising (10b).

- (10) a. Mennirnir/*Mönnunum vonast til [að PRO verða hjálpað]. *Control*
 men.the.NOM/*DAT hope for to be helped
 ‘The men hope to be both helped.’
 b. Mönnunum/*Mennirnir virðist [~~mönnunum~~ hafa verið hjálpað]. *Raising*
 men.the.DAT/*NOM seem have been helped
 ‘The men seem to have both been helped.’

Consider (ii), “reconstruction” contrasts.⁶ The raised nominal can be interpreted in its original merge position, but a controller must be interpreted in the matrix clause because it has no embedded copy (PRO is *not* a copy). This contrast shows up in many ways; we illustrate it here with scope reconstruction (11) and with Weak Crossover effects (12).⁷

- (11) a. Seven contestants are likely to lose on the next round. *Raising*
 7con.>> likely, likely>>7con.
 b. Seven contestants are afraid to lose on the next round. *Control*
 7con.>> afraid, *afraid>7con.
 (12) a. His_i medical condition worries every patient_i.
 b. His_i medical condition seems to worry every patient_i. *Raising*
 c. * His_i doctor tried to worry every patient_i.. *Control*

Such contrasts in reconstruction are consistently found in other languages as well (see Anagnostopoulou and Alexiadou 1999 on Greek, Wurmbrand 1999 on German and Baykov and Rudnev 2020 on Russian).

⁶ I use the term descriptively to mean interpretation of a lower copy than the one pronounced, with no implication of a grammatical operation of “reconstruction”.

⁷ Truswell (2013) challenges the claim that controller QPs do not reconstruct, on the basis of interactions with embedded QPs. According to the judgements he provides in (i), inverse scope is marginally possible but only when the matrix QP is the controller (i-a,d). Indiscriminate QR out of control infinitives cannot account for this pattern; instead, Truswell proposes that the controller QP may take scope in the position of PRO.

- (i) a. Mary persuaded someone to read every book on the reading list. $\exists >> \forall, \% \forall >> \exists$
 b. Someone persuaded Mary to read every book on the reading list. $\exists >> \forall, * \forall >> \exists$
 c. Mary promised someone to read every book on the reading list. $\exists >> \forall, * \forall >> \exists$
 d. Someone promised Mary to read every book on the reading list. $\exists >> \forall, \% \forall >> \exists$

Truswell does not propose to conflate raising and control; rather, he argues that scope reconstruction should be extended to non-movement dependencies as well. However, the facts in (11)/(13) and further scope interactions surveyed in the literature mentioned in the previous footnote pose considerable difficulties to this conclusion.

Scope reconstruction in raising allows the raised nominal to be interpreted *de dicto*, but a controller must be read *de re*. Under the *de dicto* reading, an indefinite nominal introduces an entity in the context of thought, hence there is no commitment to its existence in the actual world. Under the *de re* reading, an indefinite nominal introduces an entity in the context of utterance, hence it is assumed to exist in the actual world. This is reflected in the following contrast.

- (13) a. Smith expected a unicorn to drink the apple juice. *Raising*
 b. # Smith tempted a unicorn to drink the apple juice. *Control*

Parallel contrasts in reconstruction emerge when the matrix QP interacts with a negative complementizer (Baltin 2009).

Finally, we turn to (iii), derivational history. Certain grammatical conditions are sensitive to whether a given syntactic position is derived (by movement) or not. For example, Rizzi's (1986) Chain Condition blocks A-movement across a coindexed reflexive clitic (a corollary of the Minimal Link Condition; Chomsky 1995), as in *[DP_i ... *si*_i ... t_i]. This correctly predicts that subject control across a (dative) reflexive clitic will be possible (14b) but raising to subject will not (14a) (copies are marked as traces for expository purposes only). Notice that (14b) is active and not passive, the 'be' auxiliary occurring due to reflexivization.

- (14) a. *I due candidati_i *si*_i risultavano [t_i poter vincere].
 the two candidates to.each-other appeared to.be.able to.win
 ('The two candidates appeared to each other to be able to win.')
- b. I due concorrenti_i *si*_i sono promessi [di PRO_i essere leali].
 the two competitors to.each-other were promised DI to.be loyal
 The two competitors promised to each other to be loyal.'

Another derivational constraint involves *Freezing* – the ban on extraction from derived positions (Wexler and Culicover 1980). It is an old observation that the postverbal nominal in *expect*-type constructions blocks subextraction (15a,b) but that in *persuade*-type construction does not (15c,d), (Chomsky 1973, Postal 1974, Runner 2006).

- (15) a. * Who_i did you expect_k [_{VP} [stories about t_i]_j t_k [t_j to terrify John]]?
 (cf. Who_i did you hear [stories about t_i])?
- b. * Who_i did you find_k [_{VP} [pictures of t_i]_j t_k [t_j to be offensive]]?
 (cf. Who_i did you find [pictures of t_i])?
- c. Who_i did you persuade_k [_{VP} [friends of t_i]_j t_k [PRO_j to join us]]?
- d. Who_i did you push_k [_{VP} [friends of t_i]_j t_k [PRO_j to reconsider their position]]?

While Chomsky (1973), assuming no Raising to Object, traced these facts to Subjacency (more currently, the Subject Condition), on the Raising analysis they follow from the Freezing Principle.

It is worth mentioning some Raising-Control contrasts that were thought to be solid but research has proven to be unreliable. One property that was traditionally associated with raising is clause-“defectiveness”. Within the GB theory of the 1980s, this idea was cashed out in terms of clause size: Raising clauses were analyzed as bare TPs, in contrast to control clauses, analyzed as ordinary CPs. However, this idea is dubious in both directions. First, restructuring gives rise to control complements smaller than CP

in many languages (Wurmbrand 2015). Conversely, “hyper-raising” out of finite CPs is also attested in several languages (Wurmbrand 2019). While clause size often correlates with the Raising-Control contrast language-*internally*, it is not a criterion of universal validity.

A second property concerns potential overttness of the dependent position – the controllee or the raising “trace”. It is already known that overt raising is unnecessary in null subject languages; the matrix subject position may remain null (or contain a null expletive), and the nominal remains unraised in its embedded base position (see Halpert 2019 for some theoretical implications). We also know that controllees may surface as overt pronouns (see section 3.1). Finally, the phenomenon of backward control suggests that they can also surface as full lexical DPs (Polinsky and Potsdam 2002, Potsdam 2009, Fukuda 2008). Thus, how the control or raising dependency is spelled out is not a reliable distinction between the two constructions. In contrast, the properties demonstrated in (8)-(15) provide a solid battery of contrasts that have been repeatedly confirmed in the literature throughout the years.

3. A general roadmap of OC theories

Control is one of the earliest concerns of generative grammar, going back to Rosenbaum 1967. Six decades of research have produced a vast amount of findings as well as theoretical analyses. It is impossible to do justice to control theories in one Element. Instead, my strategy in this section will be to group the different proposals in three broad classes: Syntactic theories, lexical-semantic theories, and (embedded) speech act theories. These categories are natural insofar as they trace the commonalities among disparate theories in the grammatical *module* these theories take as the essential locus of the control dependency (syntax, lexicon, or syntax-pragmatics interface), abstracting away from internal differences in which features the dependency hinges on. The categories are not mutually exclusive. It goes without saying that syntactic theories acknowledge the role of lexical information in determining configurational properties. Similarly, lexical theories do not necessarily deny the existence of PRO or its relevance to control. Rather, the classification is based on what the different theories take to be the *essential* component in explaining control.

This section has two further goals. First, to highlight the important insights gained over the years from the syntactic and lexicalist approaches. Second, to highlight their intrinsic limitations. Armed with this understanding, we will turn to the speech act approach, which represents the most recent and promising avenue of research into OC, to see how it handles the challenges left open by the previous approaches.

3.1 Syntactic theories

The earliest account of OC in generative grammar was a syntactic one – The Equi-NP Deletion rule of Rosenbaum 1967, 1970. Both the relata of the rule – two identical NPs – and the rule itself were strictly syntax-internal. Moreover, the rule was subject to a syntactic locality principle – the Minimal Distance Principle (MDP) – which required the controller to be the closest NP to the controlled (deleted) NP. The MDP was revived in a PRO-based analysis by Larson (1991) (see also Martin 1996, Manzini and Roussou 2000). Within the Movement Theory of Control, the MDP was adopted as descriptively correct, its effects

reduced to the Minimal Link Condition, specifically, the ban on A-movement across an intervening A-position (Hornstein 1999 and subsequent work).

The main ingredients of Rosenbaum’s proposal have been rejected by subsequent research. This early work in the 1970s revealed that the controlled position manifests interpretive properties typical of pronouns rather than of lexical NPs (e.g., bound variable readings, split control); more fundamentally, the deletion analysis did not explain the fundamental effect of *obligatory* control, for it said nothing about why deletion is sometimes impossible (*John believed *(Mary) to be smart*), sometimes possible (*John wanted (Mary) to win*) and sometimes mandatory (*John managed (*Mary) to win*). Likewise, the MDP faced serious counterexamples from the outset, much beyond the familiar *promise*-example, which furthermore bore the unmistakable signature of *lexical* sensitivity, much to the detriment of a purely syntactic constraint. These matters have been discussed extensively elsewhere, so I do not elaborate on them here.⁸

Nonetheless, the lingering heritage of the Equi NP Deletion account was its most fundamental and yet nontrivial aspect: Superficially subjectless clauses do contain a subject at some abstract grammatical level. The nature of the abstractness was much debated in the following years, but current consensus retains the original idea that (barring reduced/restructuring complements), OC is indeed a dependence between two *syntactic* relata. The syntactic reality of PRO is revealed in a variety of interactions with syntactic processes, such as binding, agreement and case concord (see Landau 2013:chapter 3).

Perhaps the most straightforward evidence for the syntactic reality of the controlled position is the fact that in many situations, across many languages, it *is* realized by an explicit nominal. One class of cases involves controlled overt pronouns. In several Niger-Congo languages, irrealis complements of volitional and implicative verbs display OC with an obligatory pronominal subject, as in the Gã example (16a) (Allotey 2021). In other languages, typically (but not only) in Romance, PRO alternates with an overt pronoun, but the alternation is semantically significant: The controlled overt pronoun is associated with exhaustive or contrastive focus, often accompanied by some focus-sensitive particle. Example (16b) is from Hungarian (Szabolcsi 2009).

- (16) a. Gbekebii_i le nye [(ni) *(amei_i/*_j) he shia].
 Children DET managed COMP 3.PL buy.INF home
 ‘The children managed to buy a home.’
 b. Nem felejtettem el [én is aláírni a levelet].
 not forgot.1SG PFX I too to.sign the letter.ACC
 ‘I didn’t forget to bring it about that I too sign the letter.’

Controlled pronouns in Chirag Dargwa also require a focus particle, but in this language, the embedded subject may even surface as a conjunction, with the controlled pronoun (or long-distance reflexive) occurring as one conjunct, a rare case of *overt partial control* (Ganenkova 2023); on partial control, see section 3.3.

⁸ For a historical and critical discussion of Equi-NP-Deletion, see Landau 2013:3-8. For extensive discussions of the problems with MDP-based analyses, see Landau 2013:149-154, Culicover and Jackendoff 2001, Jackendoff and Culicover 2003. Note that the decisive effect of mood particles on the choice of controllers in Japanese and Korean (section 3.3) further demonstrates the inadequacy of the MDP.

Furthermore, in some languages the controlled position can surface as a full DP, a phenomenon labeled *backward control* (Polinsky and Potsdam 2002, Potsdam 2009, Fukuda 2008): The embedded subject position hosts a lexical DP and the matrix controller position is null, yet reveals its syntactic reality by a number of tests. Below is an alternation between standard (forward) and backward control in Malagasy (LNK=linker, CT=circumstantial topic (voice), TT=theme topic (voice)), taken from Potsdam 2009:765). Abstracting away from the extracted embedded object, in (17a) the controller occurs as the matrix object and surfaces with accusative case; in (17b) the controller occurs as the embedded subject and surfaces with nominative case.

(17) a. *Forward control*

trano-n' iza no naneren' i Mery ahy [hofafana]?
house-LNK who FOC force.CT Mary 1SG.ACC sweep.TT

b. *Backward control*

trano-n' iza no naneren' i Mery [hofafa- ko]?
house-LNK who FOC force.CT Mary sweep.TT 1SG.NOM
'Whose house did Mary force me to sweep?'

Pronominal control and backward control make two points eminently clear. First, OC cannot be fully reduced to a relation between a matrix predicate/argument and a subjectless clause; there must be a way to establish OC with a *syntactic controllee*. Second, PRO and pronouns do not exhaust the spellout possibilities for controlled DPs. Backward control is most readily explained by the Movement Theory of Control (MTC) as an instance of “low spellout” in an A-chain and it is still the strongest argument in its favor.⁹ It should be noted, though, that backward control is quite tricky to demonstrate; several early proposals invoking it have been retracted or reanalyzed without it (Kwon et al. 2010, Yoshimoto 2013, Alexiadou and Anagnostopoulou 2021, Pietraszko 2021). The general validity of the MTC as a viable theory of control has been subject to much criticism from different angles. If backward control will ultimately be reanalyzed in one of the ways alluded to above or otherwise, the MTC will lose its main empirical motivation.¹⁰

Within minimalism, the other main syntactic approach to OC is the Agree-based account.¹¹ On this approach, PRO enters an Agree relation with a matrix element (directly or indirectly via the embedded Agr) and consequently values its ϕ -features; on some versions, it also values an indexical feature. This agreement chain is translated at LF as variable binding. Initially, this approach was designed to capture noncanonical phenomena like finite and partial control (on partial control, see section 3.1); however, subsequent work has shown that these phenomena can also be captured under alternative conceptions (e.g., Pearson 2016, Vinka 2022).

⁹ For exposition and implementations of the MTC, see Bowers 1973, 1981, Hornstein 1999, 2003, Boeckx and Hornstein 2003, Boeckx and Hornstein 2004, 2006b, 2006a, 2007, Rodrigues 2004, 2007, Alboiu 2007, Pires 2007, Ferreira 2009, Boeckx et al. 2010a, 2010b, Hornstein and Polinsky 2010, Martins and Nunes 2017.

¹⁰ For critiques of the MTC, see Culicover and Jackendoff 2001, 2006, Landau 2003, 2007, Kiss 2004, Runner 2006, Rooryck 2007, Bobaljik and Landau 2009, Barbosa 2009, Ndayiragije 2012, Modesto 2010, 2018, Sato 2011, Wood 2012, Satik 2019.

¹¹ For exposition and implementations of the Agree-based approach, see Landau 2000, 2004, Adler 2006, Bondaruk 2006, Ussery 2008, Sheehan 2012, 2018b, McFadden 2014, Fischer 2018, McFadden and Sundaresan 2018, Douglas 2018, Fischer and Flaate Høyem 2022.

(18) a. kăbbädä l-i-bärr-Ø mărăt'ä-Ø. (Amharic)
 Kebede CM-3S.MS-fly.IMP-3SG.M prefer.PERF-3SG.M
 'Kebede preferred to fly.'

b. am uṣitə ta s u ved. (Aromanian)
 have.1SG started that PRT it see.1SG
 'I began to see it.'

There is, however, one empirical effect that falls out naturally from the Agree-based analysis of Landau 2000, 2004 but not under any alternative; it involves the so-called “Visser’s generalization”, which restricts OC by implicit passive agents (Landau 2000:169-179). As van Urk (2013) shows, the true generalization is about the interaction of implicit control and agreement.

Implicit subjects cannot control if T agrees with a referential DP.

(20) a. *Jeg ble lovet å gi meg gaver.
I was promised COMP give.INF me.ACC gifts
(Lit.) ‘I was promised to give me gifts.’
b. Det ble lovet å gi meg gaver.
there was promised COMP give.INF me.ACC gifts
(Lit.) ‘It was promised to give me gifts.’

12

van Urk reasons that RVG reflects the key role of the operation Agree is mediating OC. Following Landau 2000, 2004 (and *unlike* later executions, such as Fischer 2018, McFadden and Sundaresan 2018), he assumes that a matrix functional head mediates OC. Thus, subject control is established between the matrix subject and PRO because both Agree with T, resulting in feature sharing; object control works the same, via light v. Thus, if T is unavailable to Agree with the controller, OC fails.

van Urk further assumes that the implicit subject of passive is represented in [Spec,vP] as a syntactic D head denoting an existential quantifier, call it D_{\exists} . In impersonal passives (20b), T agrees both with this D_{\exists} and with PRO, successfully resulting in implicit subject control. In personal passives (20a), however, T agrees with the matrix goal argument, thus control by the implicit subject is rendered impossible.¹² The reason why T must Agree with the overt goal DP and not with D_{\exists} is that only the former requires case-licensing, and case-licensing is parasitic on ϕ -Agree.

Note that the RVG only specifies when implicit arguments *cannot* control; it does not specify when they *can*. It therefore makes no prediction that OC will succeed in *all* impersonal passives. Indeed, impersonal passives of implicative verbs resist OC in many languages, for reasons independent of agreement (see the discussion of (64b) below).

Currently, The RVG is only explainable on the Agree-based theory of OC and not on alternative theories, specifically on the version of that theory that depends on the mediating role of T in subject control. Before closing, let me point out two empirical challenges to the RVG – one which turns out to be spurious, the other one real. Consider first implicit subject control into adjuncts, which is not blocked by agreement with a matrix argument.

- (21) a. A shed was built to store the tools in.
 b. The game was played wearing no shoes.
 c. The president was elected without considering his competence.

These examples are problematic to the RVG only if they instantiate OC by Agree. However, implicit agent control into adjuncts is an instance of *non-obligatory* control, as shown in Landau 2017, 2021a. This is relatively easy to see in (21a), where the storer need not be the builder, but the point is more general and can be demonstrated for other types of adjuncts, using and manipulating the kind of contextual information to which NOC is sensitive, as shown in the works cited.

The other counterexample to RVG is real; it involves implicit subject control into interrogative complements as in (22a).

¹² Successful feature sharing (via Agree) between the controller and PRO does not yet guarantee a semantically felicitous result. For goal-control to be possible with *promise*, PRO must be construed as a recipient of permission (e.g., *John was promised to be allowed to watch the movie*); see Landau 2013:136-148 for extensive discussion of control shift.

- (22) a. Mary was asked where to throw the trash.
 b. Ben_i knew that Mary was asked by Sue_j where [PRO_{*i/j} to throw the trash].
 c. *Mary was asked by Ben_i when to call him_i.
 [cf. Mary was asked by Ben_i when people should call him_i]
 d. *Mary was asked how to improve myself.

(22b-d) serve to demonstrate that interrogative complements under passive verbs instantiate OC and not NOC, thus blocking long-distance, arbitrary and deictic control, respectively.¹³ Given this, (22a) is a genuine exception to the RVG and the contrast between it and (20a) remains a puzzle.

Like other syntactic approaches to OC, the Agree-based account is not free of problems. A fundamental issue, which receives no satisfactory answer, is the distribution of PRO. In the Agree model, PRO is specified [-R], which in turn can only be checked by defective T heads – lacking either semantic tense or morphological agreement. This captures a surface correlation (roughly, the aversion of indicative clauses to PRO) but is little more than a formal re-description of the problem. A second problem concerns the treatment of oblique controllers, which are quite common (e.g., *It is incumbent [upon them] to cooperate with the police*). Oblique arguments are almost universally inert for external agreement, yet they must be visible to the alleged OC-creating Agree operation – even when they cannot trigger agreement on any functional head.

In sum: OC cannot be fully explained by strictly syntactic theories, since they leave too many issues unanswered – from the lexical aspects of controller choice to atypical locality or agreement conditions (unmatched in standard instances of Move and Agree). Nonetheless, the thorough studies of OC within syntactic frameworks have uncovered a wealth of crosslinguistic data to be reckoned with in any comprehensive theory of OC. Importantly, these data establish beyond reasonable doubt that OC *does* implicate a syntactic dependency of some sort, no matter what other types of grammatical machinery it incorporates.

3.2 Lexical-semantic theories

Starting from the early 1970s, an alternative to the syntactic account of OC has developed, in which the crucial information used to establish the control relation is lexical and not syntactic. In this research tradition, control rules make reference to thematic roles, thematic hierarchies, semantic classes and other semantic notions derivable from the lexical content of the control predicate (Jackendoff 1974, Chierchia 1984, Nishigauchi 1984, Xu 1986, Sag and Pollard 1991, Ružička 1999, Rooryck 2000, 2007, Jackendoff and Culicover 2003).

Basic observations about the choice of controller motivate a lexical ingredient in any adequate account of OC.

- (23) a. Diane_i promised/pledged to Mark_j [PRO_{i/*j} to give a hand].
 b. Diane_i persuaded/encouraged Mark_j [PRO_{*i/j} to give a hand].

¹³ See Landau 2013:159-160 for further evidence that interrogative complements fall under OC (contrary what much of the earlier literature assumed). For a different view that classifies them with NOC, see Reed 2018, and for a critique of Reed's data (supporting the OC analysis) see Pitteroff and Schäfer 2019.

- (24) a. The promise that was given by Diane_i to Mark_j [PRO_{i/*j} to give a hand].
 b. Mark_j was encouraged [PRO_j to give a hand].
- (25) a. Diane_i asked/begged/said to/shouted to Mark_j [PRO_{*i/j} to give a hand].
 b. Diane_i asked/begged [PRO_{i/*j} to give a hand].
 c. Diane_i said/shouted [PRO_{*i/j} to give a hand].

Verbs with similar meanings tend to select the same argument as a controller. Thus, verbs of commitment select the source of the commitment as a controller (23a), while verbs of influence select the target of influence as the controller (23b). These roles are identified thematically and not by any syntactic position, as seen in (24). That distance (or the MDP) cannot fully address these issues is further shown in (25): While some verbs switch from object control to subject control when their object is dropped (or implicit) (25b), others resist this shift and retain the interpretation of control by the (implicit) object (25c). Once again, the relevant verb classes are semantically defined.

Throughout the years, it has proven extremely difficult to pinpoint the semantic components that determine the choice of controller. The main problem with lexicalist accounts is that the analytic categories are either vague or just approximate, with too many cases listed as “exceptions”. For example, Chierchia’s (1984) thematic hierarchy Theme > Source > Goal >... correctly predicts subject (=source) control with *promise*, but wrongly predicts it with other communication verbs like *tell*, *order* and *require*, which must be labelled as “marked”. Sag & Pollard (1991) lump all object control verbs under the category *influence*, even though the object controller of communication verbs is not influenced (e.g., observe the test *What Mary did to John was force/*tell him to clean up his room*).

Jackendoff & Culicover (2003) classify control predicates by underlying “conceptual predicates” (e.g., INTEND, OBLIGATED, REQUEST, etc.), arguing that OC is established at Conceptual Structure (CS) between a designated argument of the conceptual predicate and the embedded subject. Appeal to hidden CS predicates is problematic insofar as speakers have no direct intuitions about the meanings of these predicates; speakers can evaluate what *intend* means but not what the hypothetical INTEND does. Such explanations thus risk circularity (see Boeckx et al. 2010a:230-237 and Landau 2013:135-136 for detailed critiques).¹⁴

A fundamental shortcoming of all purely lexical theories of OC is their inability to identify the controllee position. That position can only be defined *syntactically*, as the embedded *subject*, which may bear any thematic role whatsoever (see Landau 2010:363, fn.4).

- (26) a. John planned [PRO to work harder]. PRO=agent
 b. John planned [PRO to be a TV host]. PRO=stative bearer of property
 c. John avoided [PRO receiving mail]. PRO=goal
 d. John remembered [PRO fearing ghosts]. PRO=experiencer
 e. John tried [PRO to be elected]. PRO=patient

¹⁴ Boeckx, Hornstein and Nunes (2010a) also point out weaknesses in Jackendoff & Culicover’s operation of “causative coercion”, invoked to explain control shift (see below).

Now, lexicalist theories might analyze some of these case with hidden coercion, restoring an invariant, embedded thematic role as the target of control; but that would still beg the question of why that hypothetical role must be realized as the syntactic subject of the complement. The problem is compounded in those lexicalist theories that deny the existence of a syntactic null subject and must therefore re-introduce subjecthood into the lexicon.¹⁵

Coercion is commonly invoked to explain control shift from subject to object or vice versa, as in *be-allowed-to* complements. Thus, a canonical subject control verb like *promise* shifts to object control and a canonical object control verb like *ask* shifts to subject control.

- (27) a. She promised him_i [PRO_i to be allowed to take a picture of himself].
 b. He_i asked her [PRO_i to be allowed to take a picture of himself].

The phenomenon of control shift has been documented early on (Rosenbaum 1967:92, fn. 13) and received numerous treatments; see Landau 2103:136-148 for discussion and appraisal of the different proposals. One evident implication of control shift is that the lexical semantics of the control predicate *alone* is not sufficient to determine the controller. Thus, control shift is facilitated by deagentivized and in particular by modalized complements, where PRO is construed as the recipient of permission. Unfortunately, thematic concepts like “causative” of “beneficiary”, which figure in some of the lexicalist accounts, are too coarse to pick out this specific flavor of control shift complements (see Uegaki 2011 for an attempt to formally model control shift).

More fundamentally, because both the matrix and the embedded predicate contribute to the acceptability of control shift, lexicalist accounts are led to posit cross-clausal lexical dependencies. This runs counter to the basic idea that lexical relations are strictly local (i.e., spanning a single argument structure). Of course, one can abandon this idea, as is done within HPSG and the Parallel Architecture of Jackendoff, but that would rob the debate about whether OC is to be handled in the syntax or in the lexicon of much of its interest; a lexicon rich enough to express cross-clausal dependencies is for all practical purposes already “syntactic”.

A more pressing concern is that control shift appears to be sensitive not only to strictly lexical information but also to the pragmatics of the reported event. Thus, in many languages an explicit modal is not necessary in the complement, as long as modality is somehow understood from the surrounding context. A helpful hint comes from authority relations between the two participants. Consider sentence (28a) in Hebrew. Out of the blue, it is ambiguous. Whether the object control interpretation (28b) or the subject control one is intended (28c) is entirely up to the context. If we know that the male has authority over the female, we select the former, and if we know that it is the female who has authority over the male, we select the latter interpretation.

¹⁵ See Brame 1976, Bresnan 1978, Bach 1979, Chierchia 1984, Dowty 1985, Culicover and Wilkins 1986, Jacobson 1992, Manzini and Roussou 2000, Jackendoff and Culicover 2003.

- (28) a. hu_i bikeš mimenaj [PRO_{i/j} le'hiša'er].
 he asked from.her to.stay
 b. He requested from her that she would stay.
 c. He asked for her permission to stay.

The understanding that pragmatics has an important role in choosing the controller in OC – even if syntax has a decisive role in delimiting the domain in which it must occur, in accordance with the OC Signature – has first made its entrance to control studies in Farkas 1988. Farkas introduced the semantic notion *Responsibility*: RESP(*i,s*) holds between an initiator *i* and a situation *s* just in case *i* intentionally brings about *s*. In the unmarked case, like (23a-b), the controller of an infinitive describing situation *s* is just the matrix argument that is the initiator of *s*. In control shift situations, such as (27), the controller is the individual whose actions are determined by the initiator.

While RESP in Farkas' analysis, unfortunately, is an intuitive rather than a formalized concept, it transcends the limits of strictly lexicalist accounts by explicitly incorporating pragmatic considerations. The concept of "initiator" is broader than "agent", and applies to secondary agents of passives (e.g., *King was deliberately arrested*) as well as to NOC by extra-sentential antecedents (e.g., *The shop window has a big sale sign in it in order to attract customers*). RESP is not reducible to thematic roles, and has a "global" character in that it is sensitive both to the matrix and the embedded eventuality. In these respects, it can be thought of a precursor of the Embedded Speech Act theories to be discussed in the next subsection.

Last to be mentioned within the lexicalist camp are recent attempts to model the semantics of OC using the formal apparatus of attitude reports (Stephenson 2010, Pearson 2013, 2016, 2018). These accounts are lexicalist insofar as they derive the OC dependency from the lexical denotation of the control predicate; however, that should not imply that they deny the existence of PRO (normally they acknowledge it) or the importance of syntax in feeding compositional semantics with the right structures for interpretation. Commonly in these accounts, a λ -abstractor is inserted at the edge of the complement, binding PRO and yielding a property denotation. This property serves as the first argument of the control verb, which, being an attitude predicate, quantifies over structured worlds/contexts, for example, over tuples of <individual,world,time>. It is the lexical meaning of this predicate that asserts the control implication; namely, that in each of these contexts, the complement property holds of the doxastic counterpart of the attitude holder (e.g., subject control with *want*) or of its addressee (e.g., object control with *tell*). The notion of "doxastic counterpart" encodes self-identification, accounting for the obligatory *de se* reading of PRO in attitude complements.

The biggest advantage of formal semantic analyses of OC is their explicitness; one can track exactly how the meaning of an OC construction is composed from the meaning of its parts. However, these analyses leave a few major questions unanswered.

First, the syntactic relation between the controller and PRO is lost, since PRO is locally bound by an operator, which bears no syntactic relation to the controller. This leaves unexplained the basic fact of agreement – PRO must agree with the controller, even in cases where the agreement is merely formal; see (63) below, Landau 2016b, and especially Landau 2018. Second, the formal semantic accounts do not really address the hard question of controller choice: What makes certain verbs cluster together and

differently from other verbs with respect to subject or object control? Specifying in the lexical entry of each control verb the “designated argument”, whose doxastic counterpart is identified with the individual coordinate of the world-time-individual triplet quantified over by the predicate, misses obvious generalizations that cut across OC verbs.¹⁶ Furthermore, we have seen that the relevant generalizations are sensitive to variable pragmatic information, which cannot be specified in lexical entries. Finally, the basic assumption that OC complements *uniformly* denote properties is at odds with a number of distinctions that naturally fall out of a systematic cut between property complements and propositional complements (see section 5 on the dual analysis of control).

In sum, lexicalist accounts of OC have made important contributions to our understanding that OC is not a “blind” syntactic dependency between two positions like, e.g., A-movement, which is oblivious to the semantic roles of the related positions. The semantic roles, as well as the overall construal of causal and deontic relations that tie together the matrix and the embedded eventualities, all conspire to determine which matrix argument is selected as the controller. Lexical entries cannot encode every aspect of these construals, but they certainly *restrict* the range of construals available in control constructions, and correspondingly, the choice of controller.

3.3 Embedded speech act theories

While lexicalist theories focus their attention on the argument structure of the control verb and try to formulate systematic correlations between thematic roles and controller choice, Embedded Speech Act (ESA) theories highlight the type of speech act – by which we include both actual speech acts and mental “acts” such as decisions, plans, etc. – expressed by the OC complement. The leading idea behind this approach is that the choice of controller naturally falls out from the proper identification of this speech act, using a couple of systematic “bridging” principles. These bridging principles make crucial reference to indexical information tagged on the participants in the speech event.

One can discern two strands of research converging on ESA theories. The first strand was launched in Postal 1970, specifically in the appendix to that study, and was gradually developed, syntactically and semantically, in Kuno 1972, Bianchi 2003, Schlenker 2003, 2011, Anand and Nevins 2004, Anand 2006, Baker 2008, Stephenson 2010, Landau 2015, 2018 and Stegovec 2019. The second strand has been developed within studies of OC in East Asian languages, mostly Japanese and Korean. Curiously, these two strands have evolved quite independently of each other, although they reach very similar conclusions. I will start by describing Postal’s original idea and then proceed directly to the literature on East Asian languages, which provides striking support for it.

Postal (1970) made three key observations regarding the relation between OC and ESAs. First, infinitival OC complements often have a finite counterpart with a characteristic modal. Second, the understood controller of the silent subject of the infinitive (later called PRO) corresponds to the understood antecedent of the subject pronoun in the modal finite counterpart; see the pairs (a)-(b) in (29)-(32). Third, there is a systematic correlation between the choice of matrix subject or matrix object

¹⁶ See Mucha and Hartmann 2022 for initial experimental results from German on the availability of control shift vis à vis the attitude/nonattitude distinction and the (embedded) active/passive distinction.

antecedent of the pronominal subject in the Indirect Discourse (ID) complements in the (b) examples and a 1st or 2nd pronoun in their Direct Discourse (DD) counterparts in the (c) examples.

- (29) a. Harry told Betty_i PRO_i to marry him.
 b. Harry told Betty_i that she_i should marry him.
 c. (**You**) marry me, Harry told Betty.
- (30) a. Harry asked Betty_i PRO_i to marry him.
 b. Harry asked Betty_i if she_i would marry him.
 c. Will **you** (please) marry me, Harry asked Betty.
- (31) a. Harry_i promised Betty PRO_i to leave.
 b. Harry_i promised Betty that he_i would leave.
 c. **I** will leave, Harry promised Mary.
- (32) a. Harry_i asked Betty when PRO_i to leave.
 b. Harry_i asked Betty when he_i should leave.
 c. When should **I** leave, Harry asked Betty.

The emerging generalization, which Postal stated, was this.

- (33) *Generalization*: If the DD subject is 2nd person, the ID subject (PRO) is object-controlled; if the DD subject is 1st person, the ID subject is subject-controlled.

Notice that Postal's reference to *modality* would more accurately be described today as *mood*, i.e., illocutionary force. It is the parallelism between the *force* of the complements in the (a)-(b) pairs that is tied to the choice of antecedent: For example, the subject of the content of a promise is identified with the promiser (Speaker), while the subject of the content of a directive is identified with the one being directed (Addressee). Deontic modality here is a concomitant feature of speech acts imposing commitments on either the speaker or the addressee.

As to the most interesting question of why controller choice would correlate with the *person* feature of a DD counterpart, Postal had the following to say (p. 496): "If Fact C [generalization (33), *IL*], which represents a correlation between properties of 'corresponding' Direct and Indirect Discourse sentences, is to provide an explanation for the operation of EQUI in Indirect Discourse sentences, it must be the case that underlying structures of such Indirect Discourse sentences manifest properties somehow linked to the surface properties of the relevant Direct Discourse sentences."

In other words, underlying PRO there must be some "ancestor" with properties "somehow linked" to the indexical pronouns that figure in the DD paraphrases. While current theory no longer relates ID and DD (or finite and nonfinite clauses) transformationally, Postal's insight is conceptually independent of such derivations. At its core, it amounts to the appealing idea that in those complements that paraphrase embedded speech act, OC PRO is interpreted as if it were an indexical pronoun. This

insight has proven very fruitful in subsequent work on OC. In particular, it finds interesting support in the grammatical expression of OC in East Asian languages.¹⁷

The Japanese/Korean scholarship on OC as ESA capitalizes on two observations: (i) In matrix clauses, certain mood particles restrict their subject to 1st person, 2nd person or inclusive plural 1st person (“I+you”); (ii) in embedded clauses, the very same mood particles restrict the choice of controller to the matrix speaker/author, addressee, or their combination.

Starting with (i), a 1st person subject is selected by the promissive (PRM), intensive (INT) and optative (OPT) mood markers; 2nd person is selected by the imperative (IMP) mood marker; and inclusive 1st plural person subject is selected by the exhortative (EXH) mood marker (Japanese data from Matsuda 2021:147-148).¹⁸

- (34) a. Watasi/Watasitati/??Anata/??Anatatati/??Kare/??Karera}-wa hatiji-ni kaer-**u**.
I/We/??You/??You.PL/??He/??They-TOP eight-at go.home-PRM
‘I’ll/We’ll go home at eight.’
b. *Watasi/*Watasitati/Omae/Omaetati/*Kare/*Karera-wa hayaku ronbun kak-**e**!
*I/*We/You/You.PL/*He/*They-TOP soon paper write-IMP
‘(You) write that paper soon!’
c. Watasitati/??Anatatati/*Karera-wa shukudai si-**yoo**.
We/??You.PL/*They-TOP homework do-EXH
‘Why don’t we do our homework.’ / ‘Let’s do our homework.’

To my knowledge, it was Pak et al. 2008 and Madigan 2008b, 2008a who first proposed to connect between observations (i) and (ii) and derive the choice of controller from the choice of the mood marker on the embedded clause, in other words, from the type of speech act embedded under the control verb, which is exactly Postal’s (1970) original insight. This idea has been put to use, in various forms, in Lee 2009, Seo and Hoe 2015, Sisovics 2018, Matsuda 2019, 2021 and Liao and Wang 2022.¹⁹

As Lee and Madigan observed, there must be some fit between the matrix verb and the embedded mood markers. A verb like *order* cannot embed a promise and a verb like *promise* cannot embed a directive. Nonetheless, many verbs are somewhat flexible and allow more than one choice. It is here that the effect of the mood marker is most striking. The examples below show how the choice of the embedded mood marker determines the control options under the Korean verb *mal* ‘say’ (Madigan 2008b: 167,174).

- (35) a. Inho₁-ka Hwun₂-eykey *pro*_{1/2/3} swuyeng-ha-n-ta-ko mal-ha-yess-ta.
Inho-NOM Hwun-DAT swim-do-IND-DC-C tell-do-PST-DC
‘Inho₁ told Hwun₂ that he₁/she₂/someone₃ is swimming.’

¹⁷ To streamline this idea with the upcoming analysis in section 5.1, we can re-interpret PRO in these studies as the “perspectival *pro*” in Spec,CP (Landau 2015, 2018, 2020). PRO itself is merely a λ -abstractor; the locus of the indexical information is *pro*.

¹⁸ The actual person feature of the subject need not always match its overt form, which is why some of the “mismatched” options in (34) are not totally excluded. Such “hidden” person features are familiar from the study of imperatives (e.g., *Everyone wash yourselves!*), see Zanuttini 2008.

¹⁹ See Hasegawa 2009, Stegovec 2019 and Burukina 2023 for interesting extensions of the same framework.

- b. Inho₁-ka Hwun₂-eykey PRO_{1/*2/*3} swuyeng-ha-**keyss**-ta-ko
 Inho-NOM Hwun-DAT swim-VOL-DC-C
 mal-ha-yess-ta.
 tell-do-PST-DC
 ‘Inho₁ said to Hwun₂ that he₁/*she₂/*someone would swim.’
- c. Inho₁-ka Hwun₂-eykey PRO_{*1/2/*3} swuyeng-ha-**la**-ko mal-ha-yess-ta.
 Inho-NOM Hwun-DAT swim-do-IMP-C tell-do-PST-DC
 ‘Inho told Hwun to swim.’
- d. Inho₁-ka Hwun₂-eykey PRO_{1+2/*1/*2/*3} swuyeng-ha-**ca**-ko mal-ha-yess-ta.
 Inho-NOM Hwun-DAT swim-do-EXH-C tell-do-PST-DC
 ‘Inho₁ said to Hwun₂ that they₁₊₂/*3 should go swimming.’

The indicative present tense marker *(n)un-ta* does not induce control (35a); the volitional marker *keyss*, which is speaker-oriented in matrix clauses, induces subject control in complements (35b); the imperative marker *la*, which is addressee-oriented in matrix clauses, induces object control in complements (35c); and the exhortative marker *ca*, which is oriented to the speaker+addressee in matrix clauses, induces split control in complements (35d).

Consider now how this causal relation between the mood marker and controller choice is cashed out in the relevant studies. In Pak et al. 2008, promises, directives, etc. are expressed by *jussive* clauses, which essentially contribute properties to the “To-Do List” of the speaker/addressee. Mood markers are functional heads projecting a JussP, establishing agreement with the local DP (= subject) and endowing it with interpretable person features, interpreted as referential presuppositions. They also introduce a λ -binder to bind the subject variable and produce the property added to the To-Do List (Zanuttini et al. 2012).

In embedded contexts, the speaker/addressee participant is shifted to the reported speech (or thought) event. If c^* is the utterance context and c' is the reported context, then $\text{Speaker}(c')$ and $\text{Addressee}(c')$ will pick out the subject and object of the matrix verb, respectively. This is achieved by context shift, in analogy to treatments of indexical shift, where the attitude verb is taken to quantify over contexts, e.g., tuples of $\langle \text{world, time, speaker, addressee} \rangle$ (Schlenker 2003). Pak, Portner and Zanuttini (2008) and Madigan (2008a) make direct reference to [Person] as the key feature identifying the matrix controller, whereas Madigan (2008b) uses thematic roles like Agent to do so. However, both assume that PRO is, in essence, a shifted indexical.

The Embedded Speech Act theory of OC is appealing in a number of ways and seems particularly suitable for East Asian languages. It is predicated on a very natural intuition – namely, that (attitude) OC verbs are just an instance of verbs introducing indirect discourse; that this discourse typically involves deontic commitments to bring about a certain state of affairs; and that the identity of the party entrusted with bringing it about is systematically correlated with, and predictable from, the type of thought or speech act involved (intention, promise, directive, exhortation, etc.). Finally, it offers a natural account of the *de se* reading characteristic of PRO in attitude complements; it is

essentially reduced to the obligatory *de se* reading associated with 1st person indexicals.²⁰

One general puzzle about OC that may receive a principled explanation within the Embedded Speech Act theory is the existence of Partial Control (PC) (Wilkinson 1971, Landau 2000, 2004, 2016b, Sheehan 2012, 2014, 2018a,b, White and Grano 2014, Pearson 2016, Grano 2017a, Pitteroff et al. 2017, Pitteroff and Sheehan 2018, Authier and Reed 2018, 2020). In genuine PC, the referential relation between the controller and the controllee is a subset relation, rather than identity (the latter is the case only in “fake PC”, see Pitteroff et al. 2017, Pitteroff & Sheehan 2018). The “residue”, uncontrolled part is picked up from salient antecedents (in discourse or in the conversational context; a PC construal is notated below as index “i+” on PRO).

(36) We thought that...

- a. The chair_i preferred [PRO_{i+} to gather at 6].
- b. Bill_i regretted [PRO_{i+} meeting without a concrete agenda].
- c. Mary_i wondered [whether PRO_{i+} to apply together for the grant].
- d. It was humiliating to the chair_i [PRO_{i+} to disperse so abruptly].

PC is attested in complements of attitude predicates; thus, it is not available, e.g., in implicative complements (37a). Furthermore, the plurality of PRO under PC is of a rather abstract nature, resisting morphological plural marking as well as distributive readings (37b-c) (Landau 2016a, 2016b, Authier and Reed 2018, 2020), at least in most languages.

- (37) a. *(We thought that) John_i managed [PRO_{i+} to gather at 6].
b. *(We thought that) the chair_i preferred [PRO_{i+} to work as partners].
c. (We thought that) Helen wanted [PRO_{i+} to (*each) answer a different question].

There is a great deal more to say about PC; recent research has documented restricted deviations from the generalizations exemplified in (37) in various languages, which space limitations prevent us from discussing (see Landau 2024). Nevertheless, these core properties hold across many languages and constructions to warrant a principled explanation.

While PC can be modelled in many different ways – via syntactic agreement, lexical entailments or pragmatic implicatures – many of these ways remain descriptive. A true insight appeared in Matsuda 2019, 2021, where a link between PC and the associative semantics of indexical pronouns was proposed. Matsuda’s account proceeds in two steps. First, it is noted that the standard semantics of [person] is associative; thus, *we* means “a group including the speaker” and *you*_{PL} means “a group including the addressee” (rather than “speakers” and “addressees”); see Noyer 1992, Cysouw 2003, Bobaljik 2008, Wechsler 2010. Indeed, this is how indexical features are interpreted within the presuppositional approach to ϕ -features (Heim 2008, Kratzer 2009):

²⁰ More precisely, both 1st person pronouns and subject-controlled PRO are interpreted via a semantic predicate that picks out a self-identifying participant, namely Speaker/Author(c), producing a *de se* reading; and both 2nd person pronouns and object-controlled PRO are interpreted via a semantic predicate that picks out a participant identified as an addressee, namely Addressee(c).

- (38) a. $[[[AUTHOR]]]^{g,c} = \lambda x_e: x$ includes the speaker/thinker in c.x
 b. $[[[ADDRESSEE]]]^{g,c} = \lambda x_e: x$ includes the addressee in c.x

Second, following the Embedded Speech Act theory, OC PRO is essentially an indexical pronoun – 1st person in subject control and 2nd person in object control. Thus, the associative semantics is available *by default* to OC PRO in attitude contexts (reported speech or thought) and requires no special amendments.

Nonetheless, as pointed out in Landau 2015:35-37, a full reduction of OC PRO to shifted indexicals still faces significant difficulties. First, the distribution of shifted indexicals is very different from that of OC PRO, being restricted to a handful of verbs (often no more than three), in contexts of indicative (uncontrolled) complements, often distinguishing between 1st and 2nd person pronouns, etc, not to mention that OC is by far more common than indexical shift. Perhaps the most immediate challenge to this theory is the fact that unlike shifted indexicals, OC PRO conceals its indexical character and inherits its morphological [person] value from the controller (as indicated on agreeing elements).

- (39) a. John planned [PRO_[pers:3] to promote himself/*myself].
 b. John planned: “I will promote myself.”

As Landau (2015:37) observes, “This mismatch between the form and semantic value of OC PRO in attitude contexts is... particularly thorny for the indexical shift theory, since on this theory, PRO is *inherently specified* as the context’s author or addressee, just as the pronouns *I* and *you* are. To reconcile these facts, one would have to maintain that only in the case of shifted indexicals (but not in the case of unshifted ones) are [person] features semantically interpreted but morphologically unspecified, and that a separate process of agreement (with the controller) guarantees their morphological valuation.” Indeed, recognizing the agreement problem in the analysis of Korean OC, Seo & Hope (2015) go as far as proposing that despite appearances, OC complements are not embedded jussive clauses but rather embedded subjunctive clauses whose heads do not encode indexical information.

The morphological features of PRO present a genuine problem for Embedded Speech Act theories of OC, which persists in more sophisticated implementations, like Matsuda 2019, 2021. As the authors before her, Matsuda assumes that OC complements are evaluated against a shifted context. However, in her account, PRO is not a minimal pronoun, but rather intrinsically valued for participant features – [+SP,-AD] for speaker, [-SP,+AD] for addressee and [+SP,+AD] for inclusive speaker. These are crucially semantic features, anchored to a given context, as distinct from morphological person features. Matsuda proposes that when anchored to the utterance context, these features yield an overt pronoun with 1st or 2nd person morphology. However, when anchored to the shifted context, they yield a controlled null 3rd person subject – i.e., PRO.

Distributional and typological issues that face the reduction of PRO to shifted indexicals face this proposal too. In addition, because it rejects the minimal pronoun analysis, Matsuda’s account is committed to a three-way *lexical* distinction between three types of PRO: a 1st person PRO for speaker control, a 2nd person PRO for addressee control, and a person-less PRO for nonattitude control.

While the anchoring of the pronoun's interpretation to context is semantically natural, the anchoring of its *spellout* to context leaves open the question of why null PRO cannot occur in embedded object positions. In Matsuda 2019:109 this is attributed to agreement with T, governed by locality. However, Matsuda (2021) discards this idea, presumably to avoid positing a [Tense] feature on PRO. This overgenerates pronouns specified, e.g. [+SP_c, -AD_c] (with *c* the reported context) even in embedded object positions. Finally, the possibility of 1st/2nd person PRO becomes a problem, especially when they are misaligned with the [SP]/[AD] coordinates of the utterance context.

- (40) a. You decided [PRO to harm yourself].
 Controller: [-SP_{c*}, +AD_{c*}]; PRO: [+SP_c, -AD_c]
 b. You urged me [PRO to harm myself].
 Controller: [+SP_{c*}, -AD_{c*}]; PRO: [-SP_c, +AD_c]

Here, it seems that PRO *morphologically* agrees with the controller. However, because her spellout rules cannot generate 1st/2nd person on PRO, Matsuda is led to suggest that PRO is *always* 3rd person, even in (40a-b), and that the reflexives agrees directly with the controller. This, however, runs counter to standard conceptions of agreement and binding, and (as Matsuda 2019:192 admits) cannot explain why the same agreement facts hold when the reflexive is read *de se*, namely, on its natural reading, where it is semantically bound by PRO.²¹

Overall, then, Embedded Speech Act theories of OC offer an insightful treatment of the *de se* interpretation, of the occurrence of mood markers in OC complements, of controller choice and of the existence of PC. However, they still grapple with the morphological agreement properties of OC PRO.

5. Non-obligatory control

OC clauses display a characteristic internal morphosyntax. In most languages, an OC clause is nonfinite and its subject is null. However, we have also seen cases where the OC clause is finite and cases where its subject is overt (section 3.1). Whichever shape OC clauses take in a given language, their external distribution is severely limited; they only display OC in very specific environments. When they occur elsewhere, we observe Non-obligatory control (NOC). In other words, NOC is how we designate the non-OC behavior of clauses that *can* display OC in principle. Clauses that never display OC to begin with, e.g. finite clauses in most languages, are perforce not eligible to NOC; their uncontrolled behavior is more transparently described as No Control (NC), even when harboring a null subject. As we will see below, the interpretive profile of NOC PRO is more restricted than just any pronoun, including *pro*.

To illustrate, Spanish infinitives display OC in complement position (41a) but finite complements display NC (41c). Correspondingly, the former display NOC in subject position (41b) and the latter maintain their NC character there (41d).

²¹ On the challenges that *de re* reflexives pose to theories of agreement and binding see Heim 1994 and Sharvit 2011. See Landau 2018 on the specific problem they pose for property-based theories of OC and Pearson 2018 for a proposal how to address these problems.

- (41) a. Juan_i quería [PRO_{i/*j} comprar un caballo]. OC
 Juan wanted to.buy a horse
 ‘Juan wanted to buy a horse.’
- b. [PRO comprar un caballo] sería un error. NOC
 to.buy a horse would.be an error
 ‘To buy a horse would be an error.’
- c. Juan_i recordó [que pro_{i/j} había comprado un caballo]. NC
 Juan remembered that had bought a horse
 ‘Juan remembered that he had bought a horse.’
- d. [Que pro compro un caballo] fue un error. NC
 that bought a horse was an error
 ‘That he bought a horse was a mistake.’

While the general principles governing the interpretation of *pro* are well worth studying and often overlap those that govern NOC, they will be set aside below. With this in mind, we can turn to a descriptive definition of NOC, constructed in opposition to the OC signature in (4).

(42) *The NOC signature*

In a control construction [... [_S PRO ...] ...], if:

- a. The controller need not be a grammatical element, and when it is, need not be a co-dependent of S, AND
- b. PRO need not be interpreted as a bound variable (i.e., it may be a free variable)

then this is a *Non-Obligatory Control* construction.

As noted in Landau 2013:231, fn.2, studies of NOC have almost exclusively focused on English. This assessment is still largely true, so one should bear in mind that much of what follows has yet to be tested across many more languages.

While OC and NOC tend to align with different syntactic configurations, the alignment is not absolute. Thus, OC is canonically attested in selected complements and in a few types of adjuncts (see section 5.2 on adjunct control), whereas NOC is canonically attested in subject/extraposed clauses and also in certain types of adjuncts. However, oddballs exist on both sides. OC into subject clauses is found with evaluative adjectives and *easy*-adjectives (Landau 2013:41-43). Conversely, NOC is also found in some selected complements, as will be shortly seen.

A variety of NOC examples in English is presented below. Note that the controller of PRO is rather free in these examples, corresponding to one or two long-distance antecedents, a deictic participant, or some arbitrary referent. Below we examine these interpretive options more closely.

(43) *NOC in English*

- a. *Subject clause (Super-Equi)*
 John_i finally realized that [PRO_{i+j} hurting each other] really bothered Sue_j.
- b. *Subject clause (deictic control)*
 Clearly, [PRO confessing my crime] was not something they anticipated.

- c. *Extraposed clause*
I never understood why it is bad for health [PRO_{arb} to stuff oneself with marshmallows].
- d. *Temporal adjunct*
[After PRO pitching the tents], darkness fell quickly.
- e. *'Without'-clause*
There will be no progress [without PRO investing economic and human resources].
- f. *Infinitival relative*
Is there anywhere [PRO to stay for the night] in this town?

All these examples share the NOC property in (42a) – the controller is not a co-dependent of the nonfinite clause containing PRO. The same point can be demonstrated using VP-ellipsis. While OC PRO inside in an ellipsis site only admits a sloppy reading, NOC PRO allows a strict reading as well (Nishigauchi 1984, Bouchard 1985), since its controller is not confined to the clause containing the infinitive or gerund.

- (44) a. John_i tried [PRO_i to leave early],
and Bill_j did too ~~try~~ [~~PRO_{j/*i} to leave early~~].
- b. John_i realized that [PRO_i introducing himself] would help everyone,
and Mary_j did too ~~realize that~~ [~~PRO_{i/j} introducing himself/herself~~] ~~would help everyone~~.

To illustrate property (42b), consider the following pair.

- (45) a. *OC (only sloppy reading)*
[Only Bill]_i expects [PRO_i to recite *The Tiger*].
- b. *NOC (sloppy or strict reading)*
[Only Bill]_i expected that [[PRO_i reciting *The Tiger*] would impress Jane].

(45a) asserts the Bill is the only person X who entertained the expectation that X would recite *The Tiger*. In contrast, (45b) is ambiguous. On the sloppy reading it asserts that Bill is the only person X who entertained the expectation that X's reciting *The Tiger* would impress Mary. On the strict reading it asserts that Bill is the only person who entertained the expectation that Bill's reciting *The Tiger* would impress Mary. Thus, if both Bill and Peter, and only them, expected that Bill's reciting *The Tiger* would impress Mary, the sloppy reading of (45b) would be true but the strict reading false.

For a long while it has been assumed that NOC never occurs in complements (Manzini 1983, Koster 1984, Vanden Wyngaerd 1994, Landau 2000; although see Jackendoff and Culicover 2003 for a dissenting view). In particular, Landau (2013:section 1.6) has argued that all apparent cases of NOC into complements conceal one of two possible complications: Either the true controller is a local implicit argument (hence, this is OC), or the complement is not really a complement of V but is rather embedded inside a nominalization (whose head is null), where the extra intervening structure is responsible for NOC. While these analyses are supported for many if not most of the relevant cases, they cannot fully eliminate NOC into complements. Genuine NOC is attested in complements to communication verbs, as shown in Landau 2020.

Landau (2020) discusses example of the following kind.

(46) Dad said [PRO to be quiet].

Here the controller of PRO is not overtly specified. Many authors have taken this property as sufficient grounds for classifying such examples as NOC (Williams 1980, Bresnan 1982, Bouchard 1984, Huang 1989, Sag and Pollard 1991 and Dalrymple 2001). However, the relevant interpretations discussed do not really establish NOC, as the reference of PRO is linked to the local implicit goal of *say*. The question is whether this reading exhausts the possibilities. Landau (2020) argues that it does not.

Consider the goal-less appearance of *say* (or similar verbs, like *order*, *recommend* etc.) in a richer context.

(47) Dad is reading in the living room. Jen, his older daughter, is there too, working on the computer. The little boys are in their room, making a hell lot of noise.
Dad tells Jen to go tell the kids to be quiet. Jen walks over to the boys' room, enters it and utters:

"Dad said to be quiet" / "Dad said to behave yourselves."

The intended, perfectly natural reading of (47), cannot be rendered via an implicit controller. The addressee of dad's speech act was Jen, but in the given scenario, (47) does not mean what (48) does.

(48) Dad said to Jen [PRO to be quiet].

The only reading (48) affords is that dad said to Jen that *she* should be quiet; whereas (47) conveys the proposition that dad said to Jen that *the boys* should be quiet. The fact that PRO can bear the features [2PL], despite the fact that *Jen* bears [3SG], further illustrates that (47) is not reducible to implicit OC.

To accommodate these findings, Landau (2020) proposes that configuration alone does not fully determine the OC/NOC status of a complement, and that finer selectional distinctions are relevant as well. Specifically, the head of OC complements encodes the reported context and PRO may only be anchored to some coordinate of that context (AUTHOR or ADDRESSEE). In NOC clauses, including NOC complements, the C head is unrestricted as to which context it encodes, thus allowing PRO to be anchored to a coordinate of remote or deictic contexts.

Notably missing from the characterization of NOC in (42) is the requirement that PRO be [+human], which has regularly been taken to be definitional of NOC PRO (see Chomsky 1981:324-327 for the original observations and then much subsequent literature, e.g., Williams 1992, Kawasaki 1993, Moltmann 2006, Landau 2013). It is indeed the case that NOC PRO resists a [-human] interpretation in many contexts that would seem to support it ((49a-b) are from Chomsky 1981:324, 326; (49c) is from Williams 1992; (49d) is from Kawasaki 1993:30).

- (49) a. It is possible [PRO_{arb} to roll down the hill].
[cf. *It is possible for the rocks to roll down the hill*].
b. * [PRO to snow all day] would be a nuisance.
[cf. *For it to snow all day would be a nuisance*]
c. * The open window_i proves that [before PRO_i breaking], it was raining.

- d. # [After PRO_{arb} being spoiled in a refrigerator], there is nothing even a good cook can do.

Nonetheless, recent empirical work on NOC has unearthed naturally occurring data with inanimate NOC PRO; see especially Donaldson 2021:127-139. These examples are far less frequent than the common [+human] NOC PRO, but they still exist. (50a) is a Spanish example from Herbeck 2021:261; (50b) is from Landau 2021b:124; and (50c) is from Donaldson 2021:132.

- (50) a. En Madrid_i la policía yo creo que sí
 in Madrid the police I think that yes
 que trabaja bien [para PRO_i ser una ciudad grand
 that work.3SG well for be.INF a city big
 donde tienen más problemas que aquí].
 where have.3PL more problems than here
 ‘In Madrid_i I think that the police does work quite well, taking into account that it is a big city where they have more problems than here.’
 (Lit. [PRO_i being a big city...])
- b. [PRO_i having run smoothly for years], it was finally time for my car_i to be serviced.
- c. Sewage treatment plants do not capture all the beads which wash down the drain, so some_i inevitably end up in the sea. And [PRO_i being so small, no one really knows where they_i are going].

What is the source of this confusion over the [\pm human] value of NOC PRO? To answer this question, we must take a look at the theoretical approaches to this element.

From the outset, there have been two main approaches to the question of how the reference of NOC PRO is established. One approach holds that NOC PRO is linked to the current sentential *topic* (Bresnan 1982, Kawasaki 1993, Adler 2006, Janke and Bailey 2017, Donaldson 2021); the other approach holds that it is linked to the prominent *logophoric* center (Kuno 1975, Williams 1992, Landau 2001, Green 2018). That *both* notions are needed to fully account for NOC, and neither is reducible to the other, is proposed in Lyngfelt 2000, hinted in Landau 2013:255-256, and fully embraced in Landau 2021b (see also McFadden & Sundaresan 2018). On such a dual approach, cases like (49) would fall under logophoric control and cases like (50) would fall under topic control. Since a logophoric antecedent must harbour some mental perspective, its [+human] character follows at once.²² In contrast, topical elements may, in principle, be [-human] (we return below to the infelicity of (49b-d)).

Disentangling topicality from logophoricity is a delicate matter. The very notion of a “logophoric center” implies some salience – a discourse may introduce a number of logophoric antecedents (sentient individuals whose mental perspective is involved in the reported situation), but only one or two of them would count as salient enough for the purposes of serving as an antecedent for the logophoric element. This distance effect is

²² [+human] should be understood in a broad sense, extending to higher animals, complex machines, computers, softwares, etc.; essentially any entity to which it is possible to impute mental states. Philosophical quibbles aside, speakers freely engage in such verbal practices (e.g., *My car hates me*, *The computer tried to connect to the network but failed*).

well-known from *picture*-logophors, which are, by assumption, exempt from condition A.

(51) Ann realized that Bob disliked many pictures of himself/*herself.

Since salience plays into both topicality and logophoric antecedence, the two criteria often pick out the same antecedent. To address this confound, Landau (2021b:126) set up the following paradigm.

(52) *NOC by [-top,+log] antecedent*

- a. A: What about the certificates of appreciation? What happened to them?
B: They were handed out before announcing the winners.

NOC by [+top,-log] antecedent

- b. A: What about Mary? Is she available?
B: Well, after sneaking outside last night, her father grounded her for a week.

In both cases, utterance A establishes the topic for utterance B. The logophoric center is the implicit agent in (52a) and *her father* in (52b) (the speaker and hearer are always available as topics and logophoric centers). An implicit agent of passive is very low on the accessibility scale (Ariel 1990), certainly compared to the surface subject, and especially compared to a surface subject that is previously established as a topic. (52a), then, displays NOC by a logophoric center that is neither a topic from discourse nor from the utterance situation (it need not be the speaker). In (52b), *Mary* is the established topic, but not a logophoric center (the patient argument of *ground* bears no mental perspective to the event). Thus, it is a case of NOC by a topic that is not a logophoric center.

Thus, we conclude that topicality and logophoricity are each in itself sufficient for NOC, but neither one is necessary. This is a familiar pattern. Logophoric pronouns in West African languages (Adesola 2005) and long-distance reflexives in East Asian languages (Huang 1994, Han and Storoshenko 2012, Nishigauchi 2014) are also “doubly” licensed, either by logophoricity or by topicality. Whether this consistent duality reflects a purely grammatical system or some general cognitive feature is a question to be addressed by future research.

We now face an empirical puzzle. Granted that the logophoric path requires a [+human] PRO, the topic-oriented path still does not. But if [+human] is not strictly required of topics, why is it that NOC PRO nevertheless so often seems to resist [-human] interpretations (see (49))? Landau (2021b) suggests that topics too are preferentially human, a well-established typological finding (Givón 1976, Comrie 1981, DuBois 1987, Song 2001, Swierskia 2004). Kuno’s (2006:316) notion of Empathy Topic is particularly apt to capture the natural coupling of humanness and topics, positing that “it is more difficult for the speaker to empathize with a non-human animate object than with a human, and more difficult to empathize with an inanimate object than with an animate object.”

Thus, topic-oriented referents tend to be human because they attract the speaker’s empathy, and the speaker’s empathy is impeded by inanimate or nonhuman referent. This makes [+human] a strong default even on the topic-oriented path of NOC.

Presumably, this default can be overridden under specific discourse circumstances, such as in (50). No doubt further fine-detailed work is needed to spell out these circumstances and advance our understanding how they arise for different speakers in different languages.²³

The final kind of NOC involves meteorological and temporal predicates ((53a) is from Quirk et al. 1985:1122, (53b) is from Kortmann 1991:50 and (53c) is from Duffley 2014:181).

- (53) a. Being Christmas, the government offices were closed.
- b. Being Sunday, all banks were closed.
- c. Having rained all day long, the hill has become a virtual mud slide.

Landau (2021b) suggests that these cases also fall under topic control, adopting Erteschik-Shir's (1997) idea that the subject of these predicates is the spatio-temporal location of the event, a special kind of topic termed "stage topic". When overt, this subject of predication surfaces as a semi-argumental expletive. In contrast, *pure* expletives that fail to denote anything cannot be so used – the so-called repeatedly observed "ban on expletive PRO" ((54a) is adapted from Chomsky 1981:327, (54b) is adapted from Safir 1985:34; similar facts hold in Spanish, French and German).

- (54) a. * [PRO to be clear that we're out of fuel] would be a nuisance.
(cf. *For it to be clear that we're out of fuel would be a nuisance*)
- b. * [PRO being obvious that John was late], the ceremony didn't start until 9 PM.
(cf. *It being obvious that John was late, the ceremony didn't start until 9 PM*).

The emerging pragmatic picture of NOC is summarized in Landau 2021b as follows.

(55) *Pragmatics of NOC*

In a NOC configuration [... DP ... [PRO ...] ...] (order irrelevant), DP may control PRO iff:

- a. DP is [+topic] *or* a logophoric center.
- b. Default: [+topic] → [+human].

For further discussion of the competition between OC and NOC construals in adjuncts, see Landau 2021b:section 11.4.

5. A Dual Theory

In this section I present a comprehensive attempt to unify complement control, NOC and adjunct control, with special emphasis on the interaction of syntax and semantics in the realization of different control constructions (Landau 2015, 2018, 2020, 2021a,b). At the core of this theory is the idea that control clauses come in two types, which

²³ The idea that multiple factors – lexical, syntactic, pragmatic and processing-related – interact in the ultimate resolution of NOC as well as in determining how accessible different NOC readings are in specific environments is an insight shared by Kortmann 1991, Lyngfelt 2000, Green 2018, Donaldson 2021, Herbeck 2021 and Landau 2021b.

dictate two different modes of control resolution: One type denotes a property, and the controller is identified by direct predication. The other type denotes a proposition whose subject is a “perspectival center”, and the controller is identified by logophoric antecedence.

Dual theories of control are nothing new. Arguably, the very first theory in the field, by Rosenbaum (1967), was dual in nature, distinguishing between VP-complements, where the nonfinite VP is dominated by S only, and NP/PP-complements, where it is dominated by NP/PP over S. Later, Chomsky and Lasnik (1977) formulated a dual theory, where some control structures resulted from an Obligatory Control rule (inserting PRO), and others result from a Reflexive Deletion rule, the intention being to distinguish OC structures that alternate with *for*-infinitives (and can be related to them by Reflexive Deletion) from those that do not.

Shortly after, Williams (1980) introduced his own OC-NOC distinction on the same empirical basis. Importantly, Williams was the first to propose (within the syntactic approaches to control) that OC should be reduced to predication, while NOC was analyzed as coindexation. This distinction was reincarnated in Lexical functional Grammar as the distinction between Functional Control and Anaphoric Control (Bresnan 1982, Mohanan 1983). Meanwhile, practitioners of Government and Binding hypothesized that PRO is anaphoric in IP complements and pronominal in CP complements (Bouchard 1984, Koster 1984). Within minimalism, Landau’s (2001, 2004, 2008) Agree model of OC proposed two “routes”: Direct Agree between T/v and PRO or indirect Agree through the embedded C. Finally, restructuring-oriented studies have consistently assumed two mechanisms of associating the embedded external argument with a matrix controller: One involving an independent null subject (non-restructuring), the other involving a reduced complement with no syntactic subject (restructuring); see Wurmbrand 2002, 2003, Grano 2015.

Perhaps the most immediate precursors of the dual theory to be presented here are Wurmbrand 2002 and Williams 1992. Wurmbrand proposed that controlled complement clauses may be predicative or propositional, depending on the selecting predicate. Williams proposed that controlled adjuncts combine either by predication or by logophoric anchoring. Put together, the essence of the dual theory is that the controller of a predicative clause is the argument saturating the clause, whereas the controller of a propositional clause is the argument serving as antecedent to the logophoric element in the clause. This theory will now be applied to complement clauses (section 5.1) and to adjunct clauses (section 5.2).

5.1 The Two-Tiered Theory: complement control

The starting point of the Two-Tiered Theory (henceforth, TTC) is the recognition that Williams’s fundamental insight was correct: Some understood subjects are interpreted by predication while others require reference to some “logophoric” representation of antecedents. Let us consider OC by predication first.

That predication must be involved in some cases of OC is uncontroversial; reduced complements in restructuring environments, presumably, do not project a subject position, hence their external argument is shared with that of the matrix predicate via complex predicate formation (Wurmbrand 2002, 2003). What Landau (2015) proposed, adopting earlier analyses by Chomsky 1980, Chierchia 1990 and Clark 1990, is that

clausal complements can also function as predicates if their PRO subject is treated as an operator. Specifically, a Fin head attracts PRO to its specifier, and the resulting chain is interpreted as λ -abstraction over the subject position. This is possible because PRO is a minimal pronoun devoid of any inherent denotation; hence, it cannot saturate a predicate, only form one. FinP is the projection where finiteness is encoded (Rizzi 1997); while propositional, full clauses project a CP layer above FinP (see (58)), predicative clauses lack that layer.

(56) *Predicative clause*: [_{FinP} PRO_i Fin [_{TP} PRO_i ...]]

What type of predicates instantiate OC this way, namely, by taking a predicative complement? These are the same predicates that do not license partial control (see section 3.1). Their common semantic property is that they do not introduce attitudes.²⁴

(57) *Predicative control: non-attitude predicates*

- a. Implicatives
dare, manage, make sure, bother, remember, get, see fit, condescend, try, avoid, forget, fail, refrain, decline, neglect, force, compel.
- b. Aspectual
begin, start, continue, finish, stop, resume.
- c. Modal
have, need, may, should, is able, must.
- d. Evaluative (adjectives)
rude, silly, smart, kind, (im)polite, bold, modest, cruel, cowardly, crazy.

From the semantic point of view, this is a heterogeneous class. All but the modal predicates carry some actuality entailment. Thus, positive implicative verbs (*remember*) and evaluative predicates (*rude*) entail their complement, while negative implicative verbs (*forget*) entail its negation. Aspectual verbs (*continue*) entail that the complement holds to some (possibly incomplete) degree. While some of the verbs select experiencers, the truth or falsity of the complement is evaluated not against the mental attitude of that experiencer but rather against the actual world; this is what defines these verbs as non-attitude. On Landau's (2015) analysis, a direct predication relation is established between the controller and the nonfinite complement. The resulting state of affairs is asserted to hold either in the actual world or (in the case of modal complements) in a set of possible worlds conforming to some norm. It is a defining feature of predicative control that the bearer of the property denoted by the complement is the referent of the controller *in the actual world*. Things are different in logophoric control, to which we now turn.

If predicative clauses constitute the first tier of OC, logophoric clauses are constructed as a second tier above them: A "perspectival" C head takes the FinP predicate of (56) as a complement, and projects a null *pro* as a specifier. This *pro* is associated (via a lexical presupposition on C) with a coordinate of the reported context – either the AUTHOR or ADDRESSEE of the matrix clause.²⁵ The OC dependency is broken into two

²⁴ Aspectual and modal verbs are often ambiguous between raising and control; we restrict attention to control variants below.

²⁵ This idea is embedded in a well-established conception of the left periphery of clauses, which assumes that Speech Act participants are syntactically represented and active in a variety of grammatical processes (see, among others, Bianchi 2003, Safir 2004, Speas 2004, Hill 2007, Baker 2008, Sigurðsson 2011,

links: Variable binding between the controller and *pro*, and predication between *pro* and FinP. Because PRO mediates this predication relation (being the λ -operator that binds the embedded subject position), it shares the features that *pro* received from the controller, and the FinP property is understood as holding of the AUTHOR or ADDRESSEE of the matrix clause. Note that the OC complement (=CP) denotes a proposition, differently from the OC complement (=FinP) of predicative control verbs, which denotes a property. This fundamental distinction has important repercussions, as we will see below.

(58) Logophoric clause: [CP *pro* C_{+log} [FinP PRO_i Fin [TP ~~PRO~~_i ...]]]

The predicates instantiating OC by taking a logophoric complement are the same predicates that license partial control. Their common semantic property is that they *do* introduce attitudes.

(59) *Logophoric control: attitude predicates*

- a. Factives
glad, sad, regret, like, dislike, hate, loath, surprised, shocked, sorry.
- b. Propositional
believe, think, suppose, imagine, say, claim, assert, affirm, declare, deny.
- c. Desideratives
want, prefer, yearn, arrange, hope, afraid, refuse, agree, plan, aspire, offer, decide, mean, intend, resolve, strive, demand, promise, choose, eager, ready.
- d. Interrogatives
wonder, ask, find out, interrogate, inquire, contemplate, deliberate, guess, grasp, understand, know, unclear.

In these OC complements, one observes the obligatory *de se* reading (when AUTHOR-controlled) or *de te* reading (when ADDRESSEE-controlled) of PRO; see Morgan 1970, Chierchia 1990, Percus and Sauerland 2003, Schlenker 2003, von Stechow 2003, Anand 2006, Pearson 2016, 2018, Hintzen and Martin 2021, Pearson and Roeper 2022. These readings are consistently typical of OC under attitude predicates (but not of OC elsewhere). What they amount to is the observation that an attitude OC complement contributes information not about the matrix subject (AUTHOR) or object (ADDRESSEE), but rather about “the image” these participants have in the eyes of the attitude holder; technically, the “doxastic counterparts” of the matrix participants.

The specific character of *de se/de te* readings emerges in situation of misidentification, either of the self or of the addressee.

(60) *Obligatory de se*

Context: John watches a clip of himself, caught on CCTV camera, making suspicious moves near some house at night. He doesn’t recognize himself but comes to believe that the person he watches is a burglar.

- | | | |
|----|---|----------------------|
| a. | John _i hoped that he _i would be caught. | <i>de re</i> : true |
| b. | John _i hoped [PRO _i to be caught]. | <i>de se</i> : false |

(61) *Obligatory de te*

Context: Betty is about to take Johnny to the movies. Earlier, Johnny messed up the living room, but Betty thinks it was Billy who did it. She tells Johnny: “Whoever messed up the living room should tidy it up!”.

- a. Betty told Johnny_i that [he_i should tidy up the living room]. *de re*: true
- b. Betty told Johnny_i [PRO_i to tidy up the living room]. *de te*: false

Although *de se* readings in attitude OC contexts were thought to be unshakable, recent work suggests that at least with some OC verbs they are pragmatically defeasible. Pearson & Roeper (2022) observe that in contexts of ignorance disclaimers, such as *unwittingly/unintentionally/unknowingly*, or under the scope of *in effect*, the *de se* entailment is excluded. They describe a context in which Mary is the judge of a baking contest and, blindfolded, tastes her own cookie without recognizing it, and then declares that whoever baked that cookie deserves the prize. The following statements are all judged true in this scenario, despite the fact that Mary made (or intended) no 1st person statement of the kind “I deserve the prize”.

- (62) a. Mary_i unwittingly/unintentionally/unknowingly claimed
[PRO_i to deserve the prize].
- b. Without realising it/In effect, Mary_i claimed [PRO_i to deserve the prize].
 - c. Mary didn’t realise it, but she_i claimed [PRO_i to deserve the prize].

Taking *in effect* as their leading cue, Pearson & Roeper write: “*In effect* does not suspend the requirement that PRO be *de se*, but rather it gives rise to apparent *de re* readings in contexts where it is irrelevant to some goal (e.g., giving a prize) whether the first person condition is met. In such contexts, an *in effect* PRO-sentence may be judged true even if the first person condition is not met, if (i) the corresponding *de re* report happens to be true, and (ii) the outcomes of the proposition expressed by the *de re* report and the (counterfactual) outcomes of the proposition expressed by the PRO-sentences are in all relevant respects the same.” (Pearson & Roeper 2022:874).

Notably, Pearson & Roeper do not describe the readings in (62) as *de re*; these readings just share a certain property with *de re* (namely, foregrounding the speaker’s perspective). It is thus still possible to maintain that *de se* is definitional for PRO in attitude OC. Furthermore, the “excluded entailment” effect is lexically restricted; while present with *claim*, it is unavailable with *want* (see Pearson & Roeper 2022 for details of the explanation).

Proceeding with the implications of *de se* construals, Landau 2018 pointed out there is a tension between the leading accounts of how PRO comes to be obligatorily construed *de se* (or *de te*) and the leading accounts of how it comes to agree with the controller. In the former category we have semantic models that take OC complements to denote properties or centered worlds (Chierchia 1984, 1990, von Stechow 2003, Stephenson 2010, Pearson 2013). In these models, PRO is bound by a λ -operator located at the edge of the complement. This operator guarantees that the OC complement be of the right semantic type required by the attitude verb. Crucially, however, the operator bears no syntactic relation to the controller; they are only related in the semantics, and indirectly so. Thus, the robust fact of agreement in OC is left unexplained, assuming, as is standard, that agreement piggybacks *some* syntactic relation.

It is worth noting that the prospects of reducing agreement to semantic matching between the controller and PRO are rather grim. This can be seen with imposter or hybrid nouns, evincing a split between their formal and semantic features. The imposter noun *the present authors* governs either 3rd person (formal) or 1st person (semantic) agreement (63a) (adapted from Collins and Postal 2012:19), and the German hybrid noun *Mädchen* governs either neuter gender (formal) or feminine gender (semantic) agreement (63b) (S. Wurmbrand, p.c.). The features of PRO are detectable on embedded, agreeing reflexives and pronouns, which must be locally bound by PRO.

- (63) a. The present authors_i plan [PRO_i to devote themselves/ourselves to ecology].
 b. Das Mädchen hat versprochen, [PRO_i sein/ihr Bestes zu geben].
 the girl has promised, its/her best to give
 ‘The girl promised to do her best.’

Without entering the intricate morphosyntax of hybrid nouns, suffice it to say that the mere availability of formal, non-semantic agreement in attitude OC complements, is an insurmountable obstacle for any attempt to reduce agreement to semantic matching. For semantic matching must make reference to the denotational values of the observed ϕ -features of PRO. However, these values can be either mismatched with the reference of the controller, or just uninterpretable. Thus, agreement in OC, including attitude OC, is an irreducible *syntactic* phenomenon. This phenomenon finds a natural explanation in the TTC insofar as it invokes variable binding and insofar as variable binding is a standard vehicle of agreement (Heim 2008, Kratzer 2009). By contrast, within the popular property-based view of OC, the explanation of agreement is “somewhat stipulative on every account” (Schlenker 2011: 1575).

Looking beyond agreement and *de se*, the TTC makes a range of predictions that have been largely confirmed. The first set of predictions follows from the highly strict nature of predication, which resists different types of “noncanonical” OC. Thus, control shift and split control are excluded with predicative complements but allowed (in principle) in logophoric ones. This is because a predicate in a given structure can only apply to a unique argument, whereas the intermediary logophoric *pro* in (58) can be anchored to either AUTHOR or ADDRESSEE coordinates, or possibly to their sum (Madigan 2008a). Likewise, “partial” readings are not obtainable under direct predication but can be modelled via an intermediate pronoun (see, e.g., Matsuda 2019). For this reason, partial control is typical of attitude complements.²⁶

The possibility of implicit control into predicative complements is less clear. Landau (2015) argued (following Landau 2010) that predicates must be saturated by overt arguments, and therefore controllers may not be implicit in aspectual or implicative constructions, as opposed to desiderative ones. In (64), this is illustrated with subject control verbs in Hebrew, where the controller becomes implicit upon passivization.

²⁶ Experimental testing of PC largely confirms the correlation between attitude complements and tolerance to PC, yet finer-grained differences in the degree of tolerance have been found across various subtypes of attitude complements (White and Grano 2014).

- (64) a. *Logophoric control*
 huxlat / tuxnan / huvtax le'hitkadem ba-projekt.
 was.decided / was.planned / was.promised to.move.forward in.the.project
 'It was decided/planned/promised to move forward with the project.'
- b. *Predicative control*
 * hufsak / nusa / niškax le'hitkadem ba-projekt.
 was.stopped / was.tried / was.forgotten to.move.forward in.the-project
 'It was stopped/tried/forgotten to move forward with the project.'

The same split is attested with object control verbs in Hebrew: Object drop is possible only with desiderative verbs and not with implicative verbs.

- (65) a. *Logophoric object control*
 ha-menahel civa / pakad / asar / laxac (alay)
 the-manager ordered / commanded / prohibited / pressured (on.me)
 lešatef pe'ula ba-misrad.
 to.cooperate action in.the-office
 'The manager ordered / commanded / forbade / pressured (me)
 to cooperate in the office.'
- b. *Predicative object control*
 Gil kafa / hikša / hekel / hišpia *(alay)
 Gil compelled/made.it.difficult/made.it.easy/influenced *(on.me)
 le'hitpater etmol.
 to.quit yesterday
 'Gil compelled / made it difficult for / made it easy for / influenced *(me)
 to quit yesterday.'

Against this evidence from Landau (2015) (who cites parallel data in Polish and Russian), Pitteroff and Schäfer (2019) point out that examples parallel to (64b), such as the Dutch example (66), are possible in a number of Germanic languages, although there is "huge variation" in judgments.

- (66) Er werd vergeten/verzuimd (om) als collectief te spelen,
 there was forgotten/missed C as collective to play,
 juist wat normaliter de sterke kracht is van het team.
 just what normally the strong power is of this team.
 'People forgot/failed to play as a collective, which usually is the strength of
 this team.'

It is notable that counterexamples to (65b) have not been reported.²⁷ One can tentatively conclude that crosslinguistic variation in the control capacity of implicit arguments is only attested with implicit *agents* of passive. Recent work indeed suggests that the binary distinction between Active and Passive Voice is an oversimplification; Voice heads come in different degrees of "strength" and featural specification (Legate 2021, Sigurðsson and Wood 2021). It is thus quite possible that these Voice heads, or the external arguments they project, would correspondingly vary in their visibility to

²⁷ It is assumed, of course, that implicit objects can be reliably distinguished from object *pro*; the latter is expected to face no difficulties in controlling a predicative complement.

grammatical dependencies such as control, predication and binding. Fleshing out the details of such a typology is a task for future research.

Let us mention two further consequences of the TTC, one concerning the *size* of the control complement and the other concerning its *semantic type*. Comparing (56) and (58), we observe that predicative clauses are smaller than logophoric ones, lacking at least the CP layer (and even more layers in restructuring complements). This is to be expected insofar as the former express modality, manipulation, phasal status and achievement, while the latter express desires, fears, epistemic states and speech acts. Typological research has shown that clausal complements of the latter type are larger than those of the former type, the difference keyed to the occurrence of designated heads in the left periphery of the clause, encoding the different types of attitudes (Lohninger and Wurmbrand 2024).

Concretely, to the extent that such functional heads are spelled out, we expect the left-periphery of logophoric complements to be more richly specified than that of predicative complements. Looking at complementizers, this tendency is consistent, although often concealed due to the common syncretism between functional heads in the left periphery (usually at most one is pronounced). In some languages infinitival complementizers distribute across verb classes with hardly any systematic restrictions (i.e., *a/de/di* prepositional complementizers in Romance, *að* in Icelandic); in others, attitude complements are introduced by overt complementizers and nonattitude complements are not. Notably, no language exhibits the opposite pattern (overt complementizers in nonattitude complements and no complementizer in attitude complements).

As an illustration, consider the distribution of the Polish complementizer *żeby* (Bondaruk 2004, Citko 2012). It is obviative with subjunctive complements and with some desiderative infinitival complements. With object control verbs and a few subject control verbs, it has no effect on control, but with many subject control verbs its presence licenses NC. What is relatively clear is that predicative complements (modal, aspectual and implicative) reject *żeby*; it only occurs in logophoric complements. For example, *żeby* may or must occur with desiderative and epistemic subject control complements (67b,c) but not with implicative complements (67a).

- (67) a. Jan_i zdołał [(**żeby*) PRO_{i/*j} śpiewać].
 Jan managed C sing.INF
 ‘Jan managed to sing.’
- b. Jan_i wolał [PRO_{i/*j} śpiewać] / Jan_i wolał [*żeby* *pro*_{*i/j} śpiewać].
 Jan preferred sing.INF Jan preferred C sing.INF
 ‘Jan preferred to sing. / Jan preferred for others to sing.’
- c. Jan marzył [**żeby*) PRO_{i/*j} śpiewać].
 Jan dreamed C sing.INF
 ‘Jan dreamed to sing.’

A parallel contrast exists between implicative and desiderative object control complements.

- (68) a. Marek_i dał mi [(*)żeby] PRO_{i/*j} poprowadzić swój samochód].
 Mark let me C drive.INF his car
 ‘Mark let me drive his car.’
 b. Jan kazał Piotrowi_i [(*)żeby] PRO_{i/*j} nie biegać po ulicy].
 John told Peter C not run.INF on street
 ‘John told Peter not to run on the street.’

A similar distribution is displayed by the jussive modals *yao* ‘must/will/want’ and its negative counterpart *bie* ‘NEG.IMP’ and *bu-yao* ‘NEG-should/NEG.IMP’ in Mandarin Chinese (Liao and Wang 2022). These are banned from predicative OC complements (69) (which must use standard negation instead) and occur only in logophoric ones (70) (note that (70b) exhibits PC as well). Liao & Wang analyze them semantically as the imperative operator of Stegovec 2019 and identify them with Landau’s C^{OC}, the complementizer of logophoric OC complements.

- (69) a. Zhangsan_i kaishi [*(**bie/bu** PRO_i zai-nali tiaowu].
 Zhangsan start NEG.IMP/NEG in-there dance
 ‘Zhangsan started to not dance in that place.’
 b. Zhangsan_i neng(gou) [*(**bie/bu** PRO_i zheme zuo].
 Zhangsan can NEG.IMP/NEG so do
 ‘Zhangsan is able to not do so.’
 (70) a. Zhangsan_i dasuan [**bie/*bu** PRO_i tai-zao jiehun].
 Zhangsan intend NEG.IMP/NEG too-early marry
 ‘Zhangsan intended not to get married too young.’
 b. Zhangsan quan Lisi_i [**bie/*bu** PRO_i zai-liu-dian jianmian].
 Zhangsan persuade Lisi NEG.IMP/NEG at-six-o’clock meet
 ‘Zhangsan persuaded Lisi not to meet at six.’

In fact, it is not required that the Fin head of predicative complements be null, as long as it is distinct from the C head of logophoric complements. A language where both heads are overt and distinct may well be Moro (Kordofanian; South Sudan), as documented in Jenks and Rose 2017. The complementizer *ná*- only occurs in implicative complements (71a) whereas the complementizer *ṭá* only occurs in logophoric complements (71b).²⁸

- (71) a. kúk:u g-əndəʈʃən-ú (n)-áŋə -lávətʃ-a ŋál:o(-ŋ)
 Kuku CLg-(RTC-)try-PFV C-3SG.INF-hide-INF Ngalo-ACC
 ‘Kuku tried to hide Ngalo.’
 b. é-g-a-mwandəð-ó kúk:u-ŋ ṭá ʔŋ-ə-ḽbúg-í ís:íə.
 1SG-CLg-RTC-ask-PFV Kuku-ACC C 3SG.INF-give-INF CLj.gun
 ‘I asked Kuku to shoot the gun.’

²⁸ Jenks & Rose (2017) observe that the attitude verb *-bwán-* ‘want’ also takes a *ná*-infinitive; this may be a case of restructuring, which is common with this verb crosslinguistically. They also note that *-ámadaṭ-* ‘help’ alternates between the two complement types, which likely reflects different interpretations (implicative or not). The data set from Moro is quite limited and further study is no doubt needed to fully understand the distribution of the two complementizers.

What is even more striking is that *nā-* also introduces non-subject relative clauses in Moro. Given the predicative analysis of OC in (71a), it is a pleasant convergence to find the same complementizer introducing both predicative OC complements and predicative modifier clauses.

A final crosslinguistic pattern which naturally falls into place under the TTC involves the tolerance of OC complements to lexical subjects. While attitude and non-attitude complements exhibit the same OC signature when their subject is null (except for the *de se/de te* property), they differ dramatically in their tolerance to a lexical subject: Only attitude complements allow it.

- (72) Complements of attitude predicates allow lexical subjects; complements of nonattitude predicates *disallow* lexical subjects.

(72) is a very broad generalization, which crucially abstracts away from the syntactic realization of the complement – finite or not, nominalized or not, etc. It was first stated by Grano (2015:19) in terms of the EC-PC contrast, but we have seen that that this contrast reflects the deeper cut between attitude and nonattitude complements.

In some languages no special grammatical device is needed to license a lexical subject in an infinitival complement (thus turning it from OC to NC); this is the situation in Malayalam (Mohanam 1982) and in Tamil (Sundaresan and McFadden 2009), the latter illustrated in (73). Note that a null subject is obligatorily controlled under both the implicative *try* and the desiderative *want*, but a lexical subject is tolerated only under *want*.

- (73) a. raman_i [PRO_{i/*j}/(**Anand*) saadatt-ai saappid_i-a] paa-tt-aan.
 Raman.NOM Anand rice-ACC eat-INF try-PST-3M.SG
 ‘Raman tried (**Anand*) to eat rice.’
 b. champa-vukku_i [PRO_{i/*j}/Sudha oru samosa-vai saappid_i-a] venḍ-um.
 Champa-DAT Sudha a samosa-ACC eat-INF want-3N.SG
 ‘Champa wants (Sudha) to eat a samosa.’

The contrast appears to be replicated in English, but this is only because *want* is an ECM verb, which can license an embedded subject, as opposed to, e.g., *decide*. What is quite clear in the Dravidian languages is that the embedded subject is licensed regardless of the *particular* matrix verb; all attitude complements, finite or nonfinite, accept lexical subjects. Even more striking evidence comes from Irish, a language notorious for its free licensing of (accusative) lexical subjects in infinitives (McCloskey 1980b, 1985, McCloskey and Sells 1988, Bondaruk 2006). Yet McCloskey (1980b) observed that the nonfinite complements of *some* predicates reject a lexical subject. Although he has not attempted any generalization, the examples he provided, given in (74a-b), contain modal and implicative verbs, namely, nonattitude predicates (Irish infinitives are formed from Verbal Nouns (VN), usually following the particle *a*). Attitude predicates, on the other hand, allow either OC or NC ((74c,d) are from Bondaruk 2006, (74e) is from McCloskey 1985).

- (74) *Nonattitude infinitival complements in Irish: ✓PRO, *lexical subject*
- a. Ní thiocfadh *pro*_i libh [PRO_i/*Nollaig imeacht chomh luath sin.
NEG could.2SG Noel leave.VN so.early
'You couldn't (*Noel) leave so early.'
 - b. Rinne sé_i iarracht [PRO_i/*na daoine teach a thógáil].
made he attempt those people house PRT build.VN
'He tries (*those people) to build houses.'
- Attitude infinitival complements in Irish: ✓PRO, ✓lexical subject*
- c. Ba mhaith liom *pro*_i [PRO_i imeacht / é a meacht].
COP good with.1SG go.VN him PRT go.VN
'I would like (him) to go.'
 - d. Tá mé sásta [PRO_i a bheith anseo].
am I glad PRT be.VN here
'I'm glad to be here.'
 - e. Bheinn sásta [iad a bheith i láthair].
I.would.be glad them PRT be.VN present
'I would be glad for them to be present.'

To see the effect of (72) in English, observe that *for*-infinitivals are excluded in nonattitude complements (Grano 2015:19). The marginal acceptability of lexical subjects in the complements of certain implicative verbs, as in (75b), is due to lexical coercion, by which the core meaning of the verb is modified or extended (see Jackendoff and Culicover 2003, Grano 2017b). However, language-internal factors, partly arbitrary in nature, somewhat obscure the picture of English infinitivals. For example, not all desiderative verbs take a *for*-infinitive (75c), and *wh*-infinitivals, although expressing attitudes, consistently reject lexical subjects (75d) (Chomsky and Lasnik 1977).

- (75) a. *John began/had [for Bill to solve the problem].
b. #John tried/managed [for Bill to solve the problem].
c. *Mary persuaded Fred [for the kids to buy ice cream].
d. *She wondered [where (*people) to go].

All these “irregularities” of infinitives disappear under finite complementation, where lexical subjects are uniformly licensed. The problem is that nonattitude predicates also reject finite complements, so there does not seem to be any clean testing ground in English where the empirical consequences of (72) can be fully observed across the attitude-nonattitude divide.

In fact, there is one testing ground that overcomes these difficulties – gerunds. English gerunds have no trouble licensing an internal subject. Therefore, when placed in complement position, the (non)availability of a lexical subject inside the gerund purely reflects general principles. As it happens, it precisely reflects (72).

Pires (2007) pointed out that gerundive complements fall into two classes: One class, which he described as [+Tense], accepts either PRO or a lexical subject, whereas the other class, [-Tense], only accepts a PRO subject. Following Landau's (2015) restatement of the [±Tense] distinction in terms of [±attitude], this split is aligned with (72).

- (76) *Nonattitude gerundive complements: ✓PRO, *lexical subject*
- a. Philip_i tried/avoided [PRO_i/*Jane driving in the freeway].
 - b. Jane_i started/resumed [PRO_i/*Frank talking to us].

Attitude gerundive complements: ✓PRO, ✓lexical subject

- c. Sue_i favored/insisted on [PRO_i/Anna moving to Chicago].
- d. They_i imagined/suggested [PRO_i/Paul joining the trip].

English has another variant of gerundive complementation, where the gerund is introduced by a preposition. These P-gerund constructions, studied in Landau 2021a, also fall into two broad categories: A causative-implicative class and a nonimplicative class. Each class consists of several subclasses, depending on the preposition involved. What is crucial to note is that all and only the complements of the implicative (nonattitude) verbs reject a lexical subject.

- (77) *Nonattitude P-gerund complements: ✓PRO, *lexical subject*
- a. She fooled us_i into [PRO_i/*Bob) thinking she was sick].
 - b. They confined Beth_i to [PRO_i/*her son's eating dog food].
 - c. John talked Sue's partner_i out of [PRO_i/*her accepting a bribe].
 - d. John restrained Sue_i from [PRO_i/*her candidate's making a long statement].

Attitude P-gerund complements: ✓PRO, ✓lexical subject

- e. He_i accused me of [PRO_i/Frank being suspended].
- f. Bill credits Jane_i with [PRO_i/David finding the courage to resist].
- g. I'd caution you_i against [PRO_i/anyone taking this too far for now].

As Landau (2021a) shows, this split is correlated with a cluster of other contrasts, all predictable from the different ways in which control is established in predicative constructions as opposed to logophoric constructions.

Generalization (72) falls out naturally from the TTC's commitment to the underlying duality of OC complementation - (56) vs. (58). In predicative control, the complement denotes a predicate; specifically, the derived predicate FinP. In logophoric control, the complement denotes a proposition; specifically, the proposition obtained from applying the predicative FinP to the logophoric *pro* in [Spec,CP]. Thus, control complements do come in two semantic types, contra the uniformist property-theories stemming from Chierchia 1984, but in line with the fundamental duality envisioned in Wurmbrand 2002. Because nonattitude verbs select properties, their complements cannot host a lexical subject, which would saturate the property and yield a type mismatch. Because attitude verbs select propositions, their complements may surface with a lexical subject. Importantly, *either* (58) (with PRO) *or* a clause with a lexical subject may satisfy the selectional requirement for a proposition. While the latter option is not consistently available in all nonfinite environments (due to poorly understood distributional restrictions), it is robust enough in those environments that allow a “fair” testing.

In the next section we will see how the property-proposition divide extends further to account for the fundamental arrangement of nonfinite adjuncts with respect to control.

5.2 The Two-Tiered Theory: Adjunct control

Throughout much of the history of work on control, adjuncts have received considerably less attention than complements. Some major theories of control have been developed without considering adjuncts at all (Sag and Pollard 1991, Landau 2000, Jackendoff and Culicover 2003); others mention adjuncts summarily, illustrating one or two types at the most, only to assimilate them to standard OC (Manzini 1983, Mohanan 1983, Clark 1990, Hornstein 1999, 2003, Pires 2007, McFadden & Sundaresan 2018, Fischer 2018). This situation has fortunately changed in recent years, with concentrated studies of adjunct control that pay much closer attention to the different types of adjuncts, their modificational flavor and how it relates to the OC/NOC classification (Green 2018, 2019 Landau 2021b, Fischer and Flaate Høyem 2022; see Williams 1992 for an important precursor). In this section I lay out the major results of this recent work and the research questions it raises.

It was Williams (1992) who first pointed out that adjuncts display a dual behavior: sometimes they pattern with OC and sometimes with NOC. Following earlier observations in Chomsky 1981:324-7, Williams noted that PRO in NOC must be [+human], a feature he attributed to its logophoric nature. OC, in contrast, operates by predication, accepting inanimate subjects and even weather-*it*. By way of illustration, consider the following examples.

- (78) a. Around here, it can't snow [before PRO_i raining]. *OC*
 b. There won't be any progress [without PRO insisting
 on guidance from the outside]. *NOC*

Williams assumed that OC and NOC adjuncts are attached at different heights; specifically, that NOC adjuncts are higher than the subject. This idea is part of what Landau (2021b:93) calls “the classical view”. On this view, OC and NOC in adjuncts are in complementary distribution, because (i) OC requires c-command by the controller, NOC does not, and (ii) OC is mandatory whenever possible (NOC is “last resort”). It follows from the classical view that NOC adjuncts are not c-commanded by the subject.²⁹

However, Green (2018) and Landau (2021b) marshal a series of arguments refuting the classical view. To begin with, OC and NOC are not mutually exclusive. Although normally in competition, the nature of this competition is pragmatic rather than grammatical, hence it is not a rigid constraint (see below). Careful testing reveals that OC and NOC can even co-exist in the same sentence (Green 2018:40). Thus, “last resort” and “elsewhere case” are the wrong concepts to describe the interplay between OC and NOC in adjuncts.

- (79) The pool_i was the perfect temperature [after PRO_{i/arb} being in the hot sun all day].

Second, NOC adjuncts can demonstrably attach below the subject. As Landau (2021b:95-6) shows, they can scope below negation and be elided as part of VP-ellipsis.

²⁹ For proponents of the classical view, see Williams 1980, Lebeaux 1984, Jones 1992, Kawasaki 1993, Landau 2000, 2013:254, Hornstein 1999, 2003, Manzini and Roussou 2000, Boeckx & Hornstein 2007, Boeckx, Hornstein & Nunes 2010, Fischer 2018, McFadden & Sundareshan 2018, Fischer and Flaate Høyem 2022.

Note that the Rationale Clause in (80a) involves speaker-control and the temporal clause in (80b) involves arbitrary control, two types of NOC.

- (80) a. The door is not open in order to greet anyone, I just needed some fresh air.
 b. In the summer, the night sky is frequently an unforgettable spectacle when camping in the desert, but in the winter it rarely is.

Third, even lower adjuncts, located inside the VP, may display NOC. Consider Object Purpose Clauses, whose embedded object is bound by (an operator bound by) the matrix Theme, and whose PRO subject may display NOC. The examples below demonstrate that this NOC reading persists even though the adjunct is necessarily VP-internal (hence, resists stranding under VP-ellipsis).

- (81) a. The sterile bandages have been placed in the small backpack
 [PRO_{arb} to use in case of serious injury],
 and the plasters have been ____ too.
 b. * The sterile bandages have been placed in the small backpack
 [PRO_{arb} to use in case of serious injury],
 but the plasters have been ____ [PRO_{arb} to use for bruises only].

Conversely, TP-adjuncts may display OC despite claims that this position is reserved for NOC (e.g., Fischer and Flaate Høyem 2022). In (82), the matrix subject can be neither a logophoric antecedent (being inanimate) or a topic (being a negative quantifier). Correspondingly, it does not qualify for NOC. The observed control relation into the initial adjunct, therefore, must be OC.

- (82) After falling into this acid, nothing survives.

See Landau 2021b:94-98 for further, extensive evidence against the classical view.³⁰

Instead of positing unmotivated correlations between an adjunct's position and the OC-NOC distinction, we should look for a theory that ties the structural position of adjuncts to something else. Landau (2021b) argues that this "something else" is *compositionality*: OC adjuncts and NOC adjuncts are of different semantic types, and this difference explains which syntactic nodes they may combine with (to yield an interpretable adjunction structure) vs. which they cannot (due to a type mismatch). Crucially, the semantic type distinction is the same fundamental distinction already

³⁰ As noted above, much existing work underestimates the availability of NOC with vP-adjuncts, due to confounded test examples, where the local subject is human and hence favored over any other antecedent *both* by the OC derivation and by the NOC derivation. Indeed, Fischer and Flaate Høyem (2022) present many examples, which are similarly confounded, to make this point for English, German and Norwegian. They do provide a few examples with inanimate subjects where NOC is allegedly impossible (ex. (17), (19)); but this does not seem to be true in general, as the following data from Landau 2021b:109-110 indicate.

- (i) Fortschritt wird hier nie passieren, [ohne PRO_{arb} eigene Fehler zuzugeben]. *German*
 progress will here never happen without own mistakes to.admit.
 'Progress will never happen here without admitting one's own mistakes.'
 (ii) Skjemaet må være ferdig utfyllt [for PRO å kunne gi råd]. *Norwegian*
 the.form must be finished filled.out for to could give advice
 'The form must be filled out completely in order to give advice.'

assumed in the TTC for complement OC; namely, the distinction between predicative clauses and propositional clauses.

While complement clauses split into these two types directly, as in (56)/(58), adjunct clauses split indirectly, via a mediating P head. This P head may be overt (*before*, *without*, *in order*, etc.) or null, as it is in rationale clauses without *in order*, stimulus clauses (e.g., *He smiled to see my response*), etc.

- (83) a. Predicative adjunct: [PP P_{Pred} [FinP PRO_i Fin [TP ~~PRO~~_i ...]]]
 b. Propositional adjunct: [PP P_{Prop} [CP *pro* C_{+log} [FinP PRO_i Fin [TP ~~PRO~~_i ...]]]]

The way these two semantic types map to control types is asymmetric. Propositional adjuncts can be realized either as NC (with a lexical subject inside the adjunct) or NOC. Predicative adjuncts can be realized either as Strict OC adjuncts, namely, adjuncts that never alternate with NOC or NC, or as the OC variant of alternating OC/NOC adjuncts.

The understanding that controlled adjuncts split in this asymmetric fashion is fairly recent. Most earlier work simply assumed that adjuncts display OC or NOC. However, Green (2018, 2019) and Landau (2021b) established a sharp dichotomy between adjuncts that never alternate with NOC and those that do.

- (84) *Controlled adjuncts in English*
 a. Strict OC adjuncts: Goal, Result, Stimulus, Subject Purpose Clause (SPC)
 b. Alternating OC/NOC adjuncts: Object Purpose Clause (OPC), Rationale, Temporal, Absolute, Justification, Telic.

For a full, systematic empirical description of all these adjuncts, see Landau 2021b. Here, we will just present a few illustrative contrasts. A result clause modifies an inchoative event by elaborating on its result (85a). As a Strict OC adjunct, its controller must be the matrix subject and no other contextually available antecedent (85b), although this would be possible with a temporal adjunct (85c) on its NOC variant, as often happens when the local subject is inanimate.

- (85) a. The door_i opened again [PRO_i to reveal a strangely decorated room].
 b. *The door_i opened again [PRO to try to close it_i].
 c. The door_i opened again [after PRO trying to close it_i]. (Green 2019:16)

Because Strict OC adjuncts are necessarily predicative, they require the presence of an overt controller (see (64b)/(65b)). Alternating OC/NOC adjuncts, on the other hand, may access an implicit controller via the propositional NOC route. We thus predict a contrast in tolerance to implicit control. The examples below compare a SPC (Strict OC) and an OPC (alternating OC/NOC), confirming the prediction: Only the latter allows the controller to be dropped in the presence of the adjunct (note that the relevant objects *are* optional, in principle).

- (86) a. We're now hiring (people).
 b. We're now hiring *(people_i) [PRO_i to manage the marketing for us]. SPC
 c. They provided (me_i) a connector cable [PRO_i to charge my device with]. OPC

The cut between the two kinds of adjuncts ultimately reflects the distinction between the basic semantic types – property vs. proposition. One of Landau's (2021b) main points is that this semantic type is independently detectable by the existence of a "propositional

variant” for the controlled adjunct. A propositional variant for a controlled adjunct is an adjunct introduced by the same preposition, contributing the same modificational relation, except that it hosts a lexical subject. While some adjuncts allow an alternation between PRO and DP (... *without Bill/PRO saying much*), others restrict the propositional variant to finite clauses (... *while PRO watching TV / while Bill watched TV*). However, insofar as such a variant exists, it indicates that the adjunct head may either be P_{Pred} or P_{Prop}, and the adjunct is classified as alternating OC/NOC. When no such variant exists, the head of the adjunct is uniquely P_{Pred}, and the adjunct is classified as Strict OC. The *Propositional Variant Criterion* (PVC) states that adjuncts without a propositional variant are strictly predicative and require Strict OC, while adjuncts with a propositional variant are either predicative (OC) or propositional (NOC).

For example, a Stimulus Clause may not host a lexical subject but a Justification Clause may, (87a) vs. (88a). Correspondingly, the former rejects non-c-commanding control (a sign of NOC) whereas the latter accepts it, (87b) vs. (88b).

- (87) a. Bill wept (*for his wife) to hear the tragic story.
 b. [Her_i kids]_j wept [PRO_{j/*i} to hear the tragic story].
- (88) a. Our life was blessed [for her being so much a part of it].
 b. Her_i kids were punished [for PRO_i letting them ruin the place].

This state of affairs is summarized in table (89).

(89) *S-selection in nonfinite adjuncts*

	Adjunct's head s-selects	Propositional variant
Strict OC adjuncts	property	–
OC/NOC adjuncts	property/proposition	+

It is striking that Strict NOC adjuncts are unattested. The best candidate for such adjuncts are Speech Act Oriented (SAO) adjuncts (Quirk et al. 1985:1068-73, Kortmann 1991, Meinunger 2006, Lyngfelt 2009, Duffley 2014:99-102), where PRO is controlled by the speaker in declarative contexts and by the addressee in interrogative contexts.

- (90) a. [PRO judging from my/*your experience], John would be better off without Mary.
 b. [PRO judging from your/*my experience], would John be better off without Mary?

However, Landau (2021b) points out that SAO adjuncts are subject to severe restrictions that do not generally apply to NOC adjuncts. First, while both types of adjuncts undergo perspectival shift when embedded, an SAO adjunct is uniquely anchored to either AUTHOR or ADDRESSEE, not both.

- (91) a. *NOC adjunct* (PRO = reported AUTHOR/ADDRESSEE)
 John_i told Mary_j that [PRO_{i/j} having such experience],
 this job would be a piece of cake.
- b. *SAO adjunct* (PRO = reported AUTHOR)
 John_i told Mary_j that [PRO_{i/*j} judging from experience],
 such offers were very rare.

Tellingly, SAO adjuncts reject lexical subjects, unlike all other NOC adjuncts.

- (92) a. *NOC adjunct*
 [His income now being secure], John is better off without Mary.
- b. *SAO adjunct*
 * [For me to be absolutely frank], John would be better off without Mary.

Landau proposes that SAO adjuncts are in fact OC adjuncts, predicated of a null nominal in the left periphery of the clause, representing the AUTHOR or ADDRESSEE.

Given this picture, table (89) represents a genuine asymmetry that calls for explanation. By default, *all* controlled adjuncts map to predicates; a subset of them map to propositions, as an additional option. What is the source of the predicative default? Landau claims that it is rooted in *Economy of Projection* (EoP): All else being equal, a more minimal structure is favored over a less minimal one (Chomsky 1991, Safir 1993, Grimshaw 1994, Bošković 1996, Speas 2006). Looking at the structures of the two types of adjuncts in (83a-b), it is clear that the predicative adjunct is more minimal than the propositional one, FinP being properly contained in CP. Predicative adjuncts account for all instances of local control; hence, they are the first choice of the child in parsing input conveying this interpretation. As positive evidence for a propositional variant, in the shape of adjuncts with lexical subjects, is gradually accumulated, the child would entertain an additional, propositional variant, along with the suitable head (P_{Prop}) (see Landau 2021b:165-171 for developmental evidence). This, in turn, would grant these adjuncts the option of NOC.

Note that EoP only regulates the choice between different derivations of *the same interpretation*. Yet OC and NOC often compete for distinct interpretations. An oft-made observation is that a local human controller is strongly favored over any alternative construal, e.g., long distance or arbitrary control (Kortmann 1991, Kawasaki 1993, Lyngfelt 2000). This has led many researchers to misclassify adjunct control as OC, as in the Italian example (93a) (Sundaresan 2014). Yet if the matrix subject is inanimate, the same type of adjunct, in the same position, supports extra-sentential control (93b) (Landau 2021b:106).

- (93) a. [PRO_{i/*j} detestando il pesce], Gianni_i compró solo carne.
 detest.GER the fish Gianni bought only meat
 ‘[PRO_{i/*j} detesting the fish], Gianni_i bought only meat.’
- b. [PRO detestando gli altri], la vita diventa difficile.
 hate.GER the others the life gets difficult
 ‘Life gets difficult when one hates the others.’

This preference is strong but not absolute (attesting to its pragmatic source). Occasionally, a local human controller can be skipped, as in the following examples from Español-Echevarría 2000:101 and Green 2018:36.

- (94) a. Bill_i will introduce the ambassador to the president [in order PRO to give him_i the opportunity to observe their reactions].
 b. Strangely, the candidates talked avidly when we_i asked them where they were from, but they hesitated [after PRO_i asking them about their work].

Why is a local human controller so strongly favored, though? The answer is straightforward. The OC derivation is guided by the locality of predication, so it clearly picks out the local subject. The NOC derivation is guided by salience along two dimensions – logophoricity and topicality (see section 4). A human antecedent is already ranked high on these two scales, as humans are the canonical perspective holders and also make better sentence topics (on the animacy hierarchy, see Comrie 1981, DuBois 1987, Song 2001, Swierskia 2004, Kuno 2006). Thus, in the common scenario of a local human subject, both the OC derivation and the NOC derivation converge on the same reading. Indeed, we might suppose that EoP will favor the OC derivation under these circumstances. Any non-local control interpretation would have to be supported by exceptional salience of the remote antecedent, surpassing that of the local human subject.

This indeed is quite rare, leading to the false impression that the OC reading somehow “blocks” the NOC reading. Strictly speaking, however, this never happens. Only when the readings coincide do the two derivations compete directly (and EoP adjudicates in favor of OC). Otherwise, the choice between the reading delivered by OC and the one (or several ones) delivered by NOC is a matter of degree, a complex interaction of pragmatic salience, processing, linear order etc. All too often the NOC reading will be ranked so low as to be practically inaccessible. Yet as far as the grammar is concerned, it is generated alongside the OC reading.

6. Open questions and challenges for future research

The goal of this Elements has been to present the major approaches to the study of control within generative grammar, with an emphasis on the significant advances made during the last 10-15 years (up to 2023). In the first part of this Elements, we have seen how the theoretical construct “obligatory control” has been gradually developed and refined in continual opposition to Raising and to pronominal anaphora. Both lexicalist and syntactic approaches contributed a wealth of observations and deepened our understanding of how control interacts with argument structure, event decomposition, and attitude ascription on the one hand, and binding, agreement and case assignment on the other hand. Nonetheless, the limitations of these approaches have pushed many authors to pursue an alternative conception of OC, which assimilates it to the grammar of embedded speech acts. Within this conception, parallels and differences are studied between OC and logophoric binding, indexical shift and similar phenomena that lie at the syntax-pragmatics interface. While many questions remain open, this approach currently holds the most promise for the future study of OC, at least its manifestation in attitude complements.

In these concluding remarks, let me list the main challenges we still face in the study of control, in the hope that future research will focus its attention on their resolution.

(95) *Current challenges to the study of control*

- a. **Backward/copy control:** What is the precise empirical scope of this phenomenon? What accounts for its rarity? How is it to be reconciled with ample evidence against a unified analysis of Raising and OC?
- b. **Partial control:** What is the best analysis of PC? Is it registered in the syntax or only in the semantics? Why does PC PRO resist distributivity?
- d. **Agreement:** Granted that PRO formally agrees with the controller, how is this to be captured under the property-based theory of OC or under the indexical-shift theory? How can these theories be modified so as to preserve their insights and yet accommodate agreement in a natural way?
- e. **The OC-NC generalization:** Why does agreement block OC in attitude complements, and why does this restriction (apparently) apply in some languages but not in others?
- f. **Overt PRO:** What demands the nullness of PRO in the general case and why is this demand lifted in certain languages? Why does the overtness of PRO depend on focus (or pitch accent) in some languages but not in others?
- g. **Adjunct control:** How does the modificational semantics of an adjunct determine its control status – Strict OC or alternating OC/NOC? What loci of crosslinguistic variation are expected or attested in the susceptibility of adjuncts to control?

No doubt, substantive answers to these questions will not only advance our understanding of control but generate novel puzzles and challenges in their turn. This, however, is only for the better.
