Slavic Clitic Systems in a Typological Perspective¹

Keywords Clitics, Clitic Cluster, Clitic Template, Linearization, Word Order, Constituency, Parametric Setting, Typology of Language, Barrier Theory, Minimality Condition

1 Aims and framework

The paper offers a description of Slavic word order systems from the viewpoint of formal typology based on such notions as syntactic type, parametric settings, basic and derived order, linearization constraints, constituency, movement, spell-out, cliticity, clitic clusters, syntax-prosody interface, and grammaticalization. The general aim is to classify Slavic word order systems with clitics on the basis of syntactic constraints without dependence on hypotheses about language-specific properties of prosodically deficient elements and to provide a viable typological classification, which can be verified by data from other world's languages.

There is an important line of research based on the hypothesis that prosodically deficient elements, proclitics and enclitics, are also syntactically deficient and constitute a natural class definable in UG (ZWICKY 1977). Along this line, the placement of clitics is determined by their intrinsic properties. Many linguists have worked out the insight that some of the mechanisms of clitic linearization are applied post-syntactically and motivated by the need to resolve a mismatch between the output of the syntax and prosodic and/or morphological requirements (cf. HALPERN 1996, FRANKS 2008:95). Recent studies of the syntax-prosody interface show a gradual increase of the emphasis made on the prosodic component at the expense of syntax. The progress in the description of Slavic languages with clitics is considerable. However, some constraints on the placement of clitics directly or indirectly entail constraints on the placement of non-clitic sentence categories. If constraints of the latter type are straightforwardly explained as an

¹ We are thankful to the FDSL-08 audience for a fruitful discussion and express personal gratitude to Guglielmo Cinque, Anastasia Giannakidou, Gaspar Ilc, Ilyana Krapova, Gilbert Rappaport, Lilia Schürcks, Radek Šimik and Hannu Tommola for their comments. We are particularly indebted to Lilia Schürcks who consulted us with Bulgarian data. Anton Zimmerling's research has been supported by the Russian Foundation of Humanities, project RFH 09-04-00297a; Peter Kosta's research has been supported by the DFG-grant.

outcome of the allegedly purely prosodic or merely morphological ordering of clitics, there is a risk of overlooking syntactic mechanisms relevant for clausal architecture. Furthermore, formal theories often define the scope of syntax differently: in some accounts word order is excluded from the syntax proper, while in other accounts ordered and re-ordered strings are generated in syntax. It is evident that typology, even formal typology should not rely on only one of the competing versions of UG. Empirically oriented studies of clitics have shown that elements labeled ‘clitics’ in the description of the world’s languages are morphologically heterogeneous and may lack general taxonomic characteristics even within one and the same language, cf. a survey made by AIKHENVALD (2002). Consistent prosodic approaches to Slavic clitics have shown that clitics sharing the same overt syntactic position at PF, may have different phonetic properties in the same language (cf. DYBO 1975).² These state-of-the-art observations indicate that the borderline between the syntax and the prosody of clitics remains unclear and the set of non-syntactic features of clitics {prosodic features $P^1, P^2 \dots P^n$ & morphological features $M^1, M^2 \dots M^n$ } is hardly a more secure basis for the analysis of word order systems with clitics than the set of constraints on word order. Therefore, in this paper we opt for a syntactic approach to Slavic word order systems with clause-level clitics. The paper has the following structure: in section 2, we analyze properties of cliticization and clitic clusters in Slavic languages; in section 3, we present the so-called Barrier Theory which explains both the late placement of clitic clusters and the splitting of clusters in syntactic terms; in section 4, Slavic word order systems are classified into four types; in section 5, we argue in favor of a unified syntactic analysis of Slavic clitic systems; in section 6, we concentrate on the phenomenon of Possessor Raising and outline a possible solution to this phenomenon; section 7 closes the paper with brief conclusions.

² A salient illustration is provided by Vassiliev-Dolobko’s law. In a group of Old Slavic dialects including Old Russian, Slavic clitics from one subclass, the so called dominant clitics, took over stress from a subclass of non-clitic word forms, the so called enclina, cf. Russ *voz* ‘carriage’. If a phonetic word consisted of an enclina hosting enclitics, the stress fell on the rightmost enclitic: {*I ne na voz že*} ‘and not on the carriage THEN’. If no enclitics were present, the stress fell on the leftmost proclitics: cf. {*I ne na voz že*} ‘AND not on the carriage’ (DYBO 1975). Clitics from a different subclass (non-dominant clitics) did not take the stress from enclinal hosts.

Names of languages and other abbreviations

Bg – Bulgarian	SC – Serbian/Croatian/Bosnian
Blr – Belorussian	Ukr – Ukrainian
Cz – Czech	Ukr dial – Ukrainian dialect
Mac – Macedonian	Ipat – Ipatjevskaja chronicle
Pol – Polish	2P – Clausal 2nd position
Ru – Russian	VA-clitics – verb-adjacent clitics'
OCS – Old Church Slavonic	TM-law – Tobler- Mussafia's law
OR – Old Russian	W-system – standard word order system with 2P clitics (p. 21)
ONR – Old Novgorod Russian	W ⁺ -system – modified word order system with 2P clitics and
OSR – Old South Russian	conditions on clitic-and-verb adjacency (p. 21)
Svk – Slovak	W*– degraded word order system with 2P clitics (p.21)
Slv – Slovene	

2 Clitic clusters

A prominent feature of Slavic word order systems is the existence of grammaticalized constraints on the placement of clause-level clitics. In a class of modern and old Slavic languages clause-level clitics form ordered clusters (or 'clitic groups'). Clitic clusters are contiguous strings of clitics arranged in a rigid order according to language-specific rules called 'Clitic Templates' in KING & FRANKS (2000), BROWNE (2008) or 'Ranking Rules' in ZALIZNJAK (1993, 2008), ZIMMERLING (2002, 2006).

2.1 The internal structure of Slavic NPs/DPs and cliticization

Our contribution highlights the fact that until now not many scholars have investigated the fact that clitics can appear in domains smaller than the clause. Languages seem to differ dramatically with respect to the possibility of deploying pronominal clitics in NPs/DPs. Whereas this is not generally tolerated in Romance, Slavic displays considerable variation. The facts are discussed in depth in FRANKS (2001). In his article, Franks shows some of the puzzles presented by NPs in Slavic, and focuses in particular on the distribution of clitics inside DPs in Bulgarian. One of the most striking facts about the use of pronominal clitics inside NPs is that they are not as free as one would expect—under the erroneous assumption that they are simply more laconic versions of full NPs. Their distribution ranges from relatively unrestricted, as in Polish (Pol), to completely dis-

allowed, as in Serbian/Croatian (SC). Most telling, however, is Bulgarian (Bg), where pronominal clitics are employed inside NPs, but with restrictions peculiar to this particular domain.

Franks turns to the systems in which NP-internal clitics either appear as regular arguments or are completely unacceptable. Polish represents the former extreme.

- (1) a. zrozumienie cię (Pol)
understanding_{.SG.N} you.Cl._{GEN}
'Informing you'
- b. moje pomaganie mu (Pol)
my_{.SG.N} helping_{.SG.N} he.Cl._{DAT}
lit. 'my helping to him'
- c. ich zaproszenie go na obiad (Pol)
they_{.GEN}.inviting_{.SG.N} he.Cl._{GEN.M.} to lunch_{.ACC.}
lit. 'their inviting of him to lunch'

The opposite extreme is represented by second position clitic languages (2P clitic languages) such as SC, Slov, Cz and Svk, which tolerate no NP-internal clitics. Consider the SC example in (2) and the Cz example in (3):

- (2) [Predstavlanje njega /*ga Mariji] (SC)
 [Introduction_{NomN} he_{GEN} /*he.Cl_{GEN} Maria_{DAT.F.3SG}]
 je iznenadilo svakoga.
 be_{AUX.3SG} surprise_{PRF.3SG.N} anyone_{ACC.M}
 ‘Introducing him to Maria surprised everybody.’
- (3) [Potupa jeha/*ho] zahanbila celý (Cz)
 [Disgrace_{Nom.Sg.F} he_{GEN}/*he.Cl_{GEN}] embarrass_{Prf.Sg.F} entire_{Acc.Sg.M}
 národ
 nation_{Acc.Sg.M}
 ‘His disgrace embarrassed the whole nation.’

Only the full pronominal *njega*, *jeho* can appear inside NP, never a clitic, such as *ga*, *ho*. In Macedonian (Mac) and Bg, on the other hand, pronominal clitics are common in the nominal domain, although with various restrictions (especially in Mac). Thus, the formally dative clitic *ni* 'our' in Bg (4) is acceptable only in a definite DP, and only in the position indicated:

- (4) a. *stolicata ni //* [**stolica ni*] (Bg)
 capital_{DEF} our_{DAT}
 ‘our capital’
- b. *mladata ni stolica //* [**mlada ni stolica*] (Bg)
 young_{DEF} our_{DAT} capital
 ‘our young capital.’
- c. *večno mladata ni stolica* (Bg)
 eternally young_{DEF} our_{DAT} capital
 ‘our eternally young capital.’
- d. [**večno mlada ni stolica*] (Bg)

Furthermore, as FRANKS (2001) and FRANKS, JUNGHANNS & LAW (2005:32) point out, *mu* in (5) can potentially refer to the *AGENT* or to the *THEME* of *predstavjaneto* ‘introducing’ but never the *GOAL*:

- (5) *predstavjaneto mu* (Bg)
 introducing_{DEF} he_{DAT}
 ‘his introducing (he introduces so.)’
 ‘the introducing of him.’
 ‘*the introducing to him (so. by so. else)’

These and related issues are examined in detail in CAINK (2000) and FRANKS (2001, 2008) and also in CINQUE & KRAPOVA (this volume) and we only refer the reader to them taking up the topic of NP/DP internal clitics in section 6. Finally, there remains the overarching question with far reaching typological consequences of why DP-internal clitics exist in Bg and Mac in the first place, since they are inadmissible in the other Slavic languages. If we take the arguments in RUTKOWSKI (2002) for granted, the noun/pronoun asymmetries and the distinction between qualifying and classifying adjectives seem to confirm the hypothesis that both Bg/Mac and Pol allow for cliticization inside the DP domain as a consequence of the greater functional structure available in these particular languages or of the fact that they employ a Verb-adjacent (VA) rather than 2P clitic placement strategy. Answering this question involves both further typological research and a more carefully articulated theory of cliticization in which to interpret this research. In section 6 below, we try to go more deeply into this problem turning first to the more general problem of Clitic Clusters and the Template Principle.

2.2 Clusters and the Template Principle

Let us use the sign '=' as a marker for a clitic boundary. The notation $X = a^\circ$ reads 'clitic a is attached to category X from the right' and a notation like $a^\circ = X$ reads 'clitic a is attached to category X from the left'. A cluster is by definition a string of clitics that neither allows insertion of non-clitic elements nor permutation of clitics, when they are contiguous. Therefore, Ranking Rules/Template Principles predict that for each two clitics a° , b° belonging to a ordered cluster $[\text{CliticP } a^\circ, b^\circ, c^\circ \dots n^\circ]$ a linear relation of the type ' $a^\circ > b^\circ$ ' (' a° precedes b° ') can be established and no alternative ordering is permitted if a° and b° are contiguous. If the clitics take a distant position and do not form a single string, this requirement does not hold. That is, if a° , b° , c° are clitic heads belonging to a cluster $[\text{CliticP } a^\circ, b^\circ, c^\circ \dots n^\circ]$, sequences like $*X = b^\circ (2) = c^\circ (3) = a^\circ (1)$ are excluded, if all these clitics are attached to one and the same sentence category X , but if b° , c° attach to X , while a° attaches to Y , sequences like $X = b^\circ (2) = c^\circ (3) Y = a^\circ (1)$ are possible. Contrary to Bošković (2001:21), disjoint placement of clusterizing clitics does not by itself defy the existence of clusters if the Template Principle is not violated and syntactic configurations with cluster splitting can be proved to be derived from configurations without splitting. Rules triggering cluster splitting are called 'Barrier Rules' in the tradition based on Zaliznjak (1993:288) (cf. also Zimmerling 2008). It is plausible to assume that the same mechanism – Barrier Rules – also triggers configurations with so called late clitic placement, where the whole cluster attaches not to first sentence category X but to some category Y to the right of X : $X[\dots Y = a^\circ (1) = b^\circ (2) = c^\circ (3)$. We address this issue later in this paper in section 3.

2.3 Clause-level clitics and clusterization in Slavic

Slavic languages only have clause-level clusterizing clitics and lack clusterization in non-predicative phrases. This feature is typologically common but not quite trivial. Some other languages allow clusterization of clitics both at the clause-level and at the phrase-level. E.g., the Arawak languages Warekena (Aikhenvald 1998:259) and Tarjana (Aikhenvald 2002:59–60) use clitic clusters both in VP and NP, and the Wakashan languages Makah and Ditidaht, according to Werle (2002), have both clausal 2P clusterizing clitics and NP-level clusterizing clitics. In Slavic languages this is strictly prohibited: the clusterizing capacity of a Slavic clitic indicates that it is a clause-level element; in the standard case it is hosted by the first syntactic element.

The positioning of Slavic clitic clusters / clusterizing clitics is subject to two relevant syntactic conditions:

- (i) Clusterizing clitics must have a slot in a Clitic Template, available only for this particular clitic or for this type of clitic (e.g., all argument dative clitics if they take the same slot in this language). Other clitics and non-clitic words do not have slots in Clitic Templates.
- (ii) Clitic clusters / clusterizing clitics have a fixed position in the clause, they attach to the clausal-initial element and form Clitic-Second orders in communicatively unmarked sentences.³

Clusterizing clitics conforming both to (i) and (ii) will be referred to as (clausal) 2P clitics. Clusterizing 2P clitics are not selective and can be inserted into different syntactic environments. In Slavic main clauses and embedded clauses without an overt complementizer, they freely attach to different kinds of initial elements. At the same time, word order systems with 2P clitics are restrictive and allow only one constituent before the clitic position: Comp/XP–CL (cf. PROGAVAC 1996, ČAVAR & WILDER 1999). This constraint is of special importance to Slavic languages, since they allow discontinuous constituents and exhibit many types of scrambling: arguments belonging to the same verbal head or even to different verbal heads often may be scrambled in their domain without yielding ungrammaticality (cf. KOSTA & SCHÜRCKS 2009:655–658). The fixed position of Slavic clitic clusters in a clause imposes a constraint on scrambling. Clitic-second orders are permitted only if syntax licenses the material before the clitics and recognizes it as a single constituent.

2.4 Syntactic clitics and prosodic clitics

Most surveys of word order systems with clitics start with a detailed discussion about general criteria of cliticity in UG. We will skip this discussion, since for the aims of our paper, it is irrelevant whether Slavic 2P clitics share all taxonomic properties with elements labeled ‘clitics’ in the descriptions of the other languages of the world. However, we specify that our approach involves analysis of

³ Clitic-Second orders may also occur in communicatively marked sentences, as, e.g., in colloquial Cz: {Contr. Topic [XP [NP *Petra*] [PP *do Francie*]]} (1)=bych (2) *ještě poslal, ale Martina do Maďarska ani náhodou* ‘I would send Petr to France, but never Martin to Hungary’ – this example is from HANA (2008). But this is due to a special parameter setting – in Cz main clauses, multi-word initial constituents serve as possible hosts for clusterizing clitics, and Cz seldom if ever makes use of derived Clitic-Third orders like * [XP [NP *Petra*] [PP *do Francie*]] (1) *poslal* (2) =bych (3) *ještě*.

syntactic, not prosodic, clitics. Prosodic clitics are elements that cannot make a phonetic word when used in isolation and must combine with other elements (both non-clitics and clitics if a language allows all-clitic words). Prosodic clitics form one phonetic word with their host. Syntactic clitics are elements taking positions that are reserved for prosodically and/or syntactically deficient expressions. It is clear that not all combinations of Slavic 2P clitics with their syntactic host – the category standing in Comp/XP – are phonetic words, since in most Slavic languages the initial group may consist of two or more stressed word forms. Furthermore, there may be a mismatch of prosodic vs. syntactic properties of 2P clitics. For instance, Bg 2P pronominal and auxiliary elements, from a syntactic point of view, are strict enclitics since they cannot be fronted and require a spelled-out host in XP. At the same time, they may occur after a pause under certain conditions as mentioned, e.g., in FRANKS (2008:100) and KOSTA (2009). In a similar way, Slovene (henceforth - Slv) 2P pronouns and Be-auxiliaries lack stress and are true prosodic clitics: they can be fronted in communicatively marked contexts, but the markedness of these contexts suggests that their canonical position is 2P and from a syntactic viewpoint they are mild enclitics. Slovene also has 2P modal auxiliaries like *mora* ‘must’ which seldom leave clausal 2P and are almost never fronted (GOLDEN & SHEPPARD 2000). The paradox is that strict encliticity of Slv *mora* cannot be explained by prosody, since *mora* is a stressed word. A similar observation on a different kind of syntactic 2P clitics in the Ukrainian dialect of Sinevir is made by TOLSTAJA (2000).

Consistent prosodic theories of Slavic clitics (cf. DYBO (1975)) account for the fact that clitics are a phonetically heterogeneous class and that combinatorial features of deficient elements may differ: a subclass of Common Slavic clitics used to take stress from a subclass of non-clitic words, while another subclass of clitics did not possess this capacity. For a consistent syntactic theory all purely phonetic/prosodic features of a subclass of clitics are irrelevant – it does not matter whether, e.g., all 2P clitics are stressed or unstressed, high tonal or low tonal etc., if all of them exhibit a uniform syntactic behavior. At the same time, it is reasonable to assume that if a language grammaticalizes a sequence of 5–7 elements with weak stress / without stress and arranges them in a rigid order, such sequences do not violate the prosodic conditions of this language.

We will advance the view that a Clitic Phrase (CliticP), i.e., a sequence of clusterizing clitics generated by some clitic template, should be analyzed as a syntactic unit, at least in Slavic languages. A single clusterizing clitic taking 2P is interpreted as a manifestation of CliticP. We do not stipulate whether all clitics in languages with clitic clusters should invariably be analyzed as heads (X^0) or left-branching elements (X^0/XP) (cf. BOŠKOVIĆ 2001), but we hope that our analysis is compatible with either approach.

- For the sake of explicitness we render two state-of-the-art generalizations:
- (iii) Slavic clusterizing clitics can only be clause-level clitics and take clausal 2P with the basic word order.
 - (iv) Slavic languages do not have any other type of clusterizing elements, except for clausal 2P clitics. Clausal 2P elements do not clusterize with non-clitic words.

In the light of (iii) and (iv), the object of our analysis may be defined as ‘clusterizing clausal 2P elements, which behave as syntactic clitics and impose constraints on the placement of other sentence categories’.

2.5 Areal Slavic types of clitic template

Originally, all Slavic languages had clusterizing clause-level clitics: according to the prediction (ii), they took clausal 2P in sentences with the basic word order Comp/XP–CL, without Barrier Rules. This is attested by the Old Novgorod Russian (ONR) system (XI–XV centuries) thoroughly investigated by ZALIZNJAK (1993:280–308). The Old South Russian word order system and, to a somewhat lesser extent, Old Church Slavonic Russian system with clausal clitics are derivable from the ONR system but have an increased number of Barrier Rules shifting clause-level clitics to the right from 2P, which is proven in ZALIZNJAK (2008). This seems to show that the principle of 2P placement did not hold for Old Russian (OR) and Old Church Slavonic (OCS) clitics, or at least for some categories of clausal clitics, notably for short pronouns which regularly showed up in the VP in these languages. However, if one analyzes the order Comp/XP...[Y]–CL as derived, not as basic, and explains it with Barrier Rules, the late placement of Old South Russian (OSC) and OCS clusterizing clitics is no longer a valid argument against the theory that their canonical position is 2P. Nevertheless, neither OSC nor OCS may be chosen as standard representatives of their syntactic type, since the percentage of clauses, where all clusterizing clitics assume a contact position and take clausal 2P are considerably lower than in other Slavic languages such as ONR, Cz, SC, Slv, or Bg.⁴

As for Modern Slavic languages, the presence/absence of constraints on the placement of clitics divides them into two groups. All present-day Slavic idioms

⁴ There is a trend in Slavic studies to exclude Bg from the list of languages with 2P pronominal and auxiliary clitics and to analyze them as verb-adjacent elements, typically left-adjoined to V or VP (cf. HALPERN 1996), or even as ‘agreement morphemes’ located in the verbal complex (cf. FRANKS 2008).

have clitics, but clusterizing clitics are only attested in South and West Slavic areas. East Slavic languages – standard Russian (Ru), standard Belorussian (Blr) and standard Ukrainian (Ukr) – lack clusterizing clitics⁵ and grammaticalized constraints on the placement of 2P clitics and on the licensing of their hosts. Such constraints are found elsewhere in South and East Slavic. Historically, the absence of clusterizing clitics in the East Slavic area results from the decline of short pronouns, but for synchronic typology this detail is irrelevant.

DIMITROVA-VULCHANOVA (1999:83) in her survey of Slavic word order systems classifies them with respect to the presence/absence of *pronominal* clusterizing clitics. A salient feature of this type of clitic is the presence of two series of forms: short forms behave as clitics and are generally excluded from contexts involving contrast, emphasis and coordination (ZALIZNJAK 1993:290), while long forms are stressed, emphatic, and pattern with NPs in syntax.⁶ Historically, a major part of Slavic object and reflexive clitics was inherited from Proto-Indo-European,⁷ while a minor part was built on the basis of Slavic long forms within the written history of Slavic languages, e.g., late contractions **jemu > mu*, **jega > ga*. The presence of short pronouns is helpful for tagging Old Slavic texts, since already the morphology and segmental structure of such elements suggests that they are clitics, while the procedure of checking the status of clitics homonymous to their stressed correlates is complicated and involves analysis of the syntactic configuration. This technical aspect aside, the presence of clusterizing particles and clustering auxiliaries is just as salient for

5 Clusterizing clitics are still characteristic of some Carpathian Ukrainian dialects (TOLSTAJA 2000), but the word order systems of these dialects are rooted in the previous stage of Old Ukrainian / Old South Russian: there is no way to derive them directly from the word order system of the standard Modern Ukrainian language.

6 We are abstracting from the analysis of CARDINALETTI & STARKE (1999), who divide syntactically deficient pronominal elements into two groups: clitics in the proper sense of the term (both prosodically and syntactically deficient, often morphologically different from the corresponding stressed form) and so called weak pronouns (syntactically deficient, but not necessarily prosodically deficient; are often morphologically homonymous to the corresponding strong (i.e., emphatic) form and sometimes show up in the same surface positions as strong forms). This theory may turn out to be useful for some other kinds of Slavic clitics, but for Slavic pronominal clitics it is redundant, since short pronominal forms, with few exceptions, are in a complementary distribution with the corresponding long forms, i.e., strong pronouns in terms of CARDINALETTI & STARKE (1999).

7 To put it more correctly, Common Slavic inherited two series of pronominal and reflexive clitics and the mapping: short form = clitic, long form = non-clitic word. The paradigms of short pronouns were defective at the beginning, but in Modern Slavic languages they are more or less symmetrical to the paradigms of long pronouns, except for the nominative forms.

West Slavic, South Slavic and Old East Slavic languages as the presence of clusterizing pronominal clitics. We therefore extend Dimitrova-Vulchanova's generalization to all clusterizing elements:

- (v) Slavic languages with clusterizing pronominal clitics always have other types of clusterizing clitics. (Modern East) Slavic languages lacking clusterizing pronominal clitics lack other types of clusterizing clitics as well.

Given that all clusterizing Slavic elements are clause-level 2P clitics (see above) the generalization (v) predicts that pronominal 2P clitics always clusterize with other types of clausal 2P clitics. This prediction is correct. As early as 1935, ROMAN JAKOBSON observed that Slavic clitic clusters typically consist of two main blocks: clusterizing particles and clusterizing pronouns as well as auxiliaries. More recent and more elaborate approaches to Slavic clitic templates show that the distinction of clitic pronouns and clitic auxiliaries is relevant. There are three areal types of Slavic clitic template: they are distinguished by the location of a slot for present tense indicative BE-auxiliaries. The West Slavic type of clitic template locates 1–2 person present tense indicative BE-auxiliaries immediately before the block of clitic pronouns [Refl + Dat + Acc]. Let us refer to this slot as AUX1.

- (6) West Slavic type of a clitic template.

[Clitic Phrase ... [Clitic Phrase AUX1] [Clitic Phrase Pronouns: Refl – Dat – Acc]].⁸

The Old Novgorod/East Slavic type of clitic template locates 1–2 p. present tense indicative BE-auxiliaries immediately after the block of clitic pronouns: [Clitic Phrase ... [Dat + Acc]...]. We refer to this slot as AUX2.

- (7) Old Novgorod/East Slavic type of a clitic template.

[Clitic Phrase ... [Clitic Phrase Pronouns: Dat - Acc] [Clitic Phrase AUX2]].⁹

Finally, South Slavic languages make use of both AUX1 and AUX2. All 1–2 p. present tense indicative BE-auxiliaries and all 3 p. present tense indicative BE-auxiliaries except for 3 Sg. =*je* take AUX1, while 3Sg. =*je* takes AUX2. This peculiar split-auxiliary placement is due to the fact that 3Sg. =*je* was made part of the clitic

⁸ In the West Slavic languages AUX1 also hosts conditional forms of BE, cf. Cz *bych*, *bys*, *by* etc.

⁹ In the Old Novgorod/East Slavic type of a clitic template the slot AUX2 does not host any other auxiliaries except for the 1–2 p. present tense indicative BE-forms.

template considerably later than other forms from the present tense indicative BE-paradigm (ZIMMERLING 2002:82).¹⁰

(8) Balkan Slavic type of a clitic template.

[Clitic Phrase ... [Clitic Phrase AUX1] [Clitic Phrase Pronouns: Refl + Dat + Acc + Gen]
[Clitic Phrase AUX2]].

AUX1 and AUX2 may attract new layers of auxiliary clitics, but Slavic languages exploit this resource to a different degree. In the Old Novgorod type AUX2 is not available for later layers of clitics. In the West Slavic type AUX1 hosts conditional BE-auxiliaries (they cannot cooccur here with present tense BE-auxiliaries). In the Balkan type both AUX1 and AUX2 are available for later layers of auxiliary clitics: AUX1 hosts conditional BE-auxiliaries (SC), future tense auxiliaries from the **hoteti* stem (SC), while AUX2 may host future tense BE-auxiliaries (only in Slv). In Bg, neither AUX1 nor AUX2 are available for later layers of clitics.¹¹

If neither AUX1 nor AUX2 are available, Slavic languages may open new slots for new types of auxiliaries. This strategy is attested at least twice. Late OR (XVI–XVII centuries) locates past tense BE-auxiliaries (used in the plusquamperfectum construction) after AUX2. Let us refer to this slot as AUX4.

(9) Late Old Russian subtype of a clitic template.

[Clitic Phrase ... [Clitic Phrase Pronouns: Dat + Acc] [Clitic Phrase AUX2] [Clitic Phrase AUX4]].

(10) Čto=*ti*=*s'a*=*jesm'*=**byl** otstupil bratu svoemu (OR, 1401–02 AC).¹²

That indeed.Cl REFL.Cl.ACC BE.Cl.AUX.PRS.1SG BE.Cl.AUX.PST.1SG give.up.PRF.3SG.M
brother.DAT.SG.M one's.own.DAT.SG.M

'That you indeed **had given up** these in favour of your brother.'

¹⁰ Note that neither West nor East Slavic languages had 3p. present tense indicative BE-auxiliaries at all.

¹¹ The future tense operator *šte* is not part of the Bg clitic cluster, although it may assume a contact position with it. *Šte* can be fronted, while Bg clusterizing clitics cannot. *Šte* also takes effect on the placement of *li* and acts as a Barrier: **šte=li xodil?* → *šte xodil=li?* Such effects were impossible if both *šte* and *li* belonged to the same clitic template. In Mac, the future tense operator *ќе* has the same prosodic features as Mac clusterizing clitics (except for *li*), so a decisive test for *ќе* is whether *ќе* can be a Barrier for any clusterizing clitics, for instance *ќе=li* in **ќе=li=xodil tam*.

¹² Example (5) is from ZALIZNJAK (2008:40). The clitic *ti* in it is a particle, not a 2p. pronoun. The OR examples are quoted here in a simplified form: we disclose the titles and diacritics and spell out the superscript letters.

The Carpatian Ukrainian dialect of Sinevir locates past tense BE-auxiliaries (in the same pluperfect construction) in AUX2: here, this slot remains available for past tense BE-auxiliaries, while present tense BE-auxiliaries take AUX1 in the Sinevir template. This West Slavic feature in the East Slavic area is likely due to the Polish influence. At the same time, the Sinevir system, unlike pure West Slavic and Balkan Slavic systems, does not put BE-conditionals in the AUX1 slot but opens a new slot for them to the left of AUX1. This feature suggests that the Sinevir system initially belonged to the Old Novgorod/East Slavic type [Clitic Phrase [Pronouns [AUX2]] but at some moment was rearranged according to the West Slavic type [Clitic Phrase [AUX1] [Pronouns]]. As a result, the Sinevir dialect displays a rare combination of three AUX slots associated with three different kinds of auxiliaries.

(11) Carpatian Ukrainian subtype of a clitic template.

[Clitic Phrase ... [Clitic Phrase AUX3] [Clitic Phrase AUX1] [Clitic Phrase Pronouns]
[Clitic Phrase AUX2]].

- (12) Ja =s'a [ščós'] [use] yr'ixuju (Ukr dial)
 I REFL.Cl._{ACC} now all.this blame.PRS.1SG
 [CP ščo može vún des' =s'a =boow [1] napiw].¹³
 [that maybe he here REFL.Cl._{ACC} BE.Cl._{AUX.PST.3SG.M} drink.PRF.3SG.M.]
 'I am still blaming him for that he probably got drunk right here', lit. 'that...
 he here=**himself**=**had** drunk'.

The entire clitic template of the Sinevir dialect is shown below in Fig. 1 (based on the description given by TOLSTAJA (2000)):¹⁴

¹³ In the Sinevir dialect clusterizing 2P clitics are not verb-adjacent. Cf. stressed elements [ščós'] and [use] intervening between a 2P clitic =s'a and the verb yr'ixuju in the first clause, the proclitic [1] intervening between a string of 2P clitics =s'a=boow and the verb napiw in the first clause. The clitic basis in the second clause is the group [vún des'] 'he here'.

¹⁴ Tolstaja lists all clusterizing clitics in the dialect but does not use a templatic notation.

Fig. 1: The clitic template of the Sinevir dialect¹⁵

In Slavic clitic templates, 2P particles normally precede the block of pronouns and auxiliaries, irrespective of the fact, whether the auxiliaries take AUX1, AUX2 or both slots.¹⁶ In the most transparent case, the blocks of 2P particles, 2P pronouns and 2P auxiliaries do not intersect in a template: clitic strings consisting of 2P particles cannot be intervened by any 2P auxiliaries and vice versa. This condition is shown in (vi): the capital letters A, B, C stand for different categories of clusterizing clitics, the lowercase letters with indexes *a*¹, *b*¹, *c*ⁿ stand for particular clitics representing categories A, B, C.

(vi) [_{Clitic Phrase} [_A *a*¹, *a*²...*a*ⁿ] [_B *b*¹, *b*²... *b*ⁿ] [_C *c*¹, *c*²...*c*ⁿ]].

The ONR clitic template is a close approximation to the ideal pattern (vi), except for the fact that it has only one slot for auxiliary clitics. In this system, every 2P particle precedes every 2P pronoun, and every 2P pronoun precedes every 2P auxiliary.

¹⁵ Fig. 1 accounts for Sinevir clitic clusters in sentences in the indicative mood.

¹⁶ The deviation from this principle of particle placement is possible in only one situation: where Slavic languages lost old clusterizing 2P particles and then inserted some of them into different slots or added new particles. Cf. 2P particles *pa* and *že* in Slovene: the first of them stands at the left margin of the Slovene clitic template, while Slovene *že* stands at the right margin.

A					B		C

Že	Li	Bo	Ti	By	Mi, ti, si, ny, vy, na, va	M'a, t'a, s'a, ny, vy, na, va, i, ju, je, ě, ja	Jesm', jesi, jesme, jeste, jesvě, jesta	

Fig. 2: Old Novgorod Russian clitic template

SC, Bg and Mac clitic templates include a clusterizing particle *li* (a^0), a block of pronouns (b^0) and two distant slots for auxiliaries (c^0). One slot (AUX1) precedes the pronouns, while another slot (AUX2) is located after them, but since elements filling AUX1 and AUX2 do not cooccur, condition (vi) is not violated in (vii).

(vii) $[\text{Clitic Phrase } [{}_A a^1] [{}_C c^1] [{}_B b^1, b^2 \dots b^n] [{}_C c^2] \sim * [{}_C c^1 [{}_B b^n] {}_C c^2]]$.

Conditions (vi) and (vii) reveal a basic principle of Slavic templates: wherever the AUX slots are located, clitic templates do not generate strings of three or more 2P clitics where two pronouns are intervened by an auxiliary or two auxiliary clitics are intervened by a pronoun.¹⁷ Old Slavic languages had a block of 2P particles (cf. Fig. 2): here, the same principle excluded insertion of 2P auxiliaries and 2P pronouns into strings of two or more 2P particles. Conditions (vi) and (vii) are rendered in form of an empiric generalization in (viii):

(viii) In Slavic languages, strings generated by clitic templates conform to the Categorical Principle: a sequence of two 2P clitics a^1, a^n representing the same category A cannot be intervened by any clitic b^n representing category B.

Generalization (viii) implies that Slavic CliticPs with clause-level 2P clitics are not just casual combinations of prosodically deficient elements that, for some reason, are arranged in a rigid order. They look like syntactic units and exhibit

¹⁷ The so called *li*-inversion in Bg, where the particle *li* moves one step back and may surface between two clusterizing pronouns, is not a counterexample, since this mechanism does not represent the basic order generated by the clitic template. Cf. Bg *Dade=mu=ga*. 'He/she gave it to him', *Dade=li=mu=ga*? 'Did he/she give it to him?' (Basic clitic order generated by the Bg clitic template, where *li* precedes other clusterizing clitics), but *Ne=mu=li=ga dade*? 'Did not he/she give it to him?' (Derived word order generated by a Barrier Rule: the Negation [_{NEGP} ne] acts as a Barrier for *li* and changes the ill-formed sequence **Ne=li=mu=ga dade*).

some (language-particular or universal) hierarchy of sentence categories. This leads to the next generalization:

- (ix) Slavic clitic templates are assembled according to the Categorical Principle: clitics are grouped according to their taxonomic category: Particle $\vee$ Pronoun $\vee$ Auxiliary. The order of non-intersecting blocks in a clitic template embodies some relevant hierarchy of sentence categories.

It is tempting to interpret the whole template from the leftmost slot to the rightmost slot as cartography of the sentence. Nothing prevents us from assuming that, say, the order of 2P particles =*že*(1)=*li* (2) =*bo* (3) =*ti* (4) =*by* (5) in the ONR system (see Fig. 2) embodies a functional hierarchy like this: Illocutionary Force (1) > Focus (2) > Cause (3) > Evidentiality (4) > Mood (5). The problem with this assumption is that it has no independent verification. But then, the ordering of particles is predicted by a simple hypothesis based not on functional hierarchies but on the chronology of cliticization:

- (x) The order of clitics inside each block of 2P clitics in a clitic template is set out by the Diachronical Principle predicting that most recent clitics adjoin to the already existing clitics of the same category from the right.

The Diachronical Principle implies that each block of clitics is ordered strictly from the left to the right and that templates can attract new elements and make them clusterizing 2P clitics. The history of Slavic languages validates this prediction. Both the left and the right parts of the ONR template conform to the Diachronical Principle. The rightmost element in the block of 2P particles *že* (1), *li* (2), *bo* (3), *ti* (4), *by* (5) is the most recent particle *by*, originally a 3p. aorist form of **byti*: it was not fully separated from the aorist paradigm in the beginning of the written period. The immediately preceding evidential particle =*ti* is Common Slavic, but it is a fossilized form of the 2p. pronoun used as ‘dativus eticus’. Since the particle *ti* results from a lexicalization process, it must be younger than the first three particles *že* (1), *li* (2), *bo* (3) inherited from Proto-Indo-European as lexical items. Hence, the stages of cliticization are clear: [Clitic Phrase [Particles : *že*, *li*, **bo**...]] $\rightarrow$ [Clitic Phrase [Particles: *že*, *li*, *bo*, **ti** ...]] $\rightarrow$ [Clitic Phrase [Particles: *že*, *li*, *bo*, *ti*, **by** ...]]. As shown by ZIMMERLING (2002:82) and ZALIZNJAK (2008:47), the right part of the ONR template may be explained by the Diachronical Principle too. Both dative and accusative clitics are Common Slavic, but short accusative pronouns retained a capacity atypical for enclitics and could adjoin to prepositions, cf. OR. *Na=m’a*, *za=s’a*, *na=ny*, *po=nj* etc. This feature implies that short accusative pronouns were made part of 2P-clusters later than short dative pronouns were, which lack this capacity. Indeed, dative pronouns, with few exceptions discussed in BROWNE (2008), precede accusative pronouns in Slavic templates. The present

tense BE-auxiliaries located immediately after accusative pronouns represent the most recent layer of clitics: it cannot be Common Slavic because of considerable divergences in the placement of auxiliary slots. Again, the stages of cliticization are transparent: [Clitic Phrase [Pronouns : **Dat...**]] → [Clitic Phrase [Pronouns : Dat **Acc...**] [...]] → [Clitic Phrase [Pronouns : Dat Acc] [Auxiliaries : **1-2 present tense indicative BE-forms ...**]].

The Diachronical Principle is subordinated to the Categorical Principle. In Slavic languages, the Diachronical Principle may add a new category to the template if there is no suitable slot in the already existing blocks: exactly this option was chosen for the auxiliary clitics in the ONR system. But it does not generate a cluster as a unit and normally does not show the relative age of clitics taking adjacent slots yet located in different blocks. E.g. we know that particle *ti* (slot 4) is older than particle *by* (slot 5), while dative clitics (slot 6) are older than accusative clitics (slot 7), but we cannot establish whether accusative clitics (slot 7) are younger than particle *ti* (slot 4): the assumption that *by* (slot 5) is older than dative clitics (slot 6) is obviously wrong.

Apart from the Categorical and the Diachronical Principle, the world's languages with clitic clusters occasionally apply the Prosodic Principle. It predicts that light (e.g., monosyllabic) clitics precede heavy (e.g., disyllabic) clitics irrespective of their category. The Prosodic Principle may be both applied in blocks of clitics (a more common option) or throughout the whole template (a more rare option). Both options are attested in the Central Philippine languages (BILLINGS & KONOPASKY 2002). In the Slavic languages the Prosodic Principle is not applied: there are no proven cases, where prosodic ordering might override the Categorical Principle.

In a survey of Slavic clitics, FRANKS (2009:733–736) following BOŠKOVIĆ (2001) lists four arguments for why Slavic clusters may not actually be syntactic units and might rather to be analyzed as prosodic or morphological units: a) disjoint placement of clitics; b) insertion of floating particles into strings of clusterizing pronouns and auxiliaries (sporadically attested in Cz and Bg); c) selective climbing of clitics (sporadically attested in SC); d) ellipsis of segments including clusterizing clitics. We cannot discuss c) and d) here, but argument a) is not sufficient by itself, since disjoint placement of clusterizing clitics is triggered by Barrier Rules and occurs in marked sentences with the derived order. The phenomenon of b) needs further investigation: it is plausible that clitic particles like Cz *už* 'already' are on the brink of clusterizing, but they have not yet received a fixed slot in the template.¹⁸ Furthermore, alternative prosodic and morphologi-

¹⁸ A similar condition is characteristic of some Ancient Greek particles.

cal approaches to clusters are problematic. For reasons specified above, Slavic clitic clusters generated by a Template cannot be analyzed as purely superficial prosodic strings lacking categorial ordering. A morphological cartographic approach to clusters is more promising, but the cartography of a cluster is often destroyed in configurations with cluster splitting of the type $X=b^\circ (2)=c^\circ (3) Y=a^\circ (1)$, where clitic a° preceding b° and c° in the Template, ends up to the right of it (see examples (15), (16), (18c) below). Such behavior of clitics does not seem compatible with standard assumptions about the nature of morphological elements.

2.6 2P clitics and non-clusterizing clitics

Slavic languages with clusterizing clitics always have non-clusterizing clitics. The reverse implication is false: all Slavic clusterizing clitics are clause-level clitics, while non-clusterizing clitics may be both clause-level and phrase-level elements. This distribution is not lexically driven: one and the same clitic may be clusterizing as a clause-level element and non-clusterizing as a phrase-level element. For instance, Slavic pronominal clitics in the dative case clusterize when used as predicate arguments but do not clusterize when used as possessive markers in NP/DPs – an option attested for Bg, Mac, OCS and OR (ZALIZNJAK 2008: 35). An exact typological parallel is found in Ossetic, an Iranian language with clausal 2P-clitics. If a dative/genitive clitic is used in Ossetic as a predicate argument, it clusterizes with other 2P-clitics. If it is used as a possessive marker in NPs, it does not clusterize. Slavic pronominal clitics in the accusative case reveal the same duality but in a slightly different configuration. If they are used as predicate arguments, they clusterize in 2P. If they adjoin to preposition heads and produce special series of bound pronouns, e.g., SC *na=me*, *na=te*, *na=nj* and similar forms in OCS and OR, they do not clusterize. ČAVAR & WILDER (1999:445) aptly observe that even when bound preposition-accusative forms are morphologically identical to free accusative clitics they retain different properties. Free accusative clitics can climb, if the language has this option, while bound accusative clitics do not leave their phrase and do not climb:

- (13) a. *da =je Ivan računao* [_{pp} *na=me*] (SC)
 That. BE._{AUX.PRS.3Sg} Ivan counted [on me]
 b. **Da=me_i=je Ivan računao* [_{pp} *na t_i*] (SC)

Slavic 2P clusters may include 4 different categories of clitics. A) Sentential 2P particles: from 0 up to 6 slots in a template. B) Argument Dative, Accusative and Genitive pronominal clitics: from 2 to 3 slots in a template (BROWNE 2008), but only two argument clitics may cooccur in a string. C) Reflexive clitics in Accusative and Dative case: from 0 to 1 slot in a template. D) Auxiliary clitics: from 1 up to 3 slots in a template, maximum 2 auxiliaries in a string. The extremum of 6 particles in a template is reached in late OR (XVI–XVII centuries) which used the clusterizing particles *=li=že=bo=ti=by=dě(i)* (cf. ZALIZNJAK 2008:44 for details). Most modern Slavic languages retain only *li* in the template or eliminate all particles. East Slavic shows a trend toward elimination of reflexive clitics from the template. The extremum of 3 AUX slots in a template is reached in the Ukrainian Sinevir system (see Fig. 1 above).

2.7 Comp/XP as a universal clitic basis and Constituency Conditions

We adopt the hypothesis of Comp/XP as a universal clitic basis, since it predicts the placement of Slavic clausal 2P elements in the best possible way and is typologically more reliable than the alternative hypothesis of 2P as a primarily phonetic phenomenon (cf. HALPERN 1996 for a different approach). In the trivial case, the clitic basis is manifested by a single stressed word form ($[_{XP} W^1]$ –CL), which gives rise to non-syntactic explanations. The apparent deviations from the trivial case of 2P clitic placement fall into two groups: 1) initial multi-word constituents in XP, with the basic word order $[_{XP} W^1 W^2 \dots W^n]$ –CL; 2) several constituents preceding clusterizing clitics, with the derived word order $[XP]$ –Y–CL. The first option depends on conditions that license some multi-word constituents in XP and block other ones: we will refer to them as Constituency Conditions. Constituency conditions in the Slavic languages are subject to parametric variation: for instance, ONR blocks all multi-word constituents consisting of two or more stressed word forms (ZALIZNJAK 1993:285), while modern Slv licenses clitic placement after sentential constituents (IP or CP). The second option depends on Barrier Rules that map basic word order with clitics in 2P onto derived word orders with late placement of clitics / cluster splitting. As demonstrated by ZALIZNJAK (1993:287), ČAVAR & WILDER (1999)¹⁹ and ZIMMERLING (2002) for various Slavic languages, the main mechanism of a Barrier Rule is strikingly uniform and involves verb raising resulting in a configuration $\#[_{BARRIER} [XP]]$ –V_i–CL ... t_i.

¹⁹ Although Čavar & Wilder do not apply the notion of Barrier, their analysis of verb raising in Croatian is largely equivalent to Zaliznjak's and Zimmerling's approaches.

Generally speaking, Slavic languages have six options for the placement of 2P clausal clitics:

- A. After the first stressed word form: obligatory in ONR, optional in OCS, OR, Svk, SC.
- B. After the first spelled-out constituent: optional in OCS, OR, SC, obligatory in other languages.
- C. After the initial proclitic: a rare option, marginally attested in OR, Bg, Slv.
- D. After the complementizer in subordinate clauses: all languages.
- E. After a quotation phrase: Cz, Slv.
- F. After a sentential constituent: only Slv.

Slv seems to be the only Slavic language to use all six options A–F. All languages conform to D and A/B, which is basically the same option in syntax. The parametric variation in the Slavic area is due to the fact that one group of languages (cf. ONR) requires splitting of a multi-word initial constituent: $[_{XP} W^1 = CL W^2 W^n]$, $*[_{XP} W^1 W^2 W^n] = CL$ – a different group of languages (e.g., Cz and Bg) ban splitting: $[_{XP} W^1 W^2 W^n] = CL$, $*[_{XP} W^1 = CL W^2 W^n]$ – whereas a third group of languages (e.g., SC and OR) allow both options: $[_{XP} W^1 = CL W^2 W^n] \sim [_{XP} W^1 W^2 W^n]$. The variation of type A ~ B is found only in the main clause. Contrary to ČAVAR & WILDER (1999), we take the orders Comp [...] CL with some category intervening between a complementizer and clusterizing clitics to be derived, not basic. Consequently, we do not need to postulate a special projection CompP hosting the complementizer and the next category in order to license sentences like (14). Sentence (14) shows the basic word order Comp–CL, while the order Comp–[XP]–CL–V in (15) is triggered by a Barrier Rule fronting a topicalized element and locating it before the clitics.

- (14) Toj kaza, $[_{CP} \text{če (1)=sŭm} \quad =mu \quad =ja (2) \quad \underline{\text{bil dal}}$
 He said that BE_{AUX.PRS.1SG.} him_{DAT.3SG.M.} t_{ACC.3SG.F} BE_{AUX.PST.3SG.M.}
 knigata]. (Bg)
 given._{-PRF.} book-the
 ‘He said that he had already given him the book.’

- (15) Toj kaza, $[_{CP} \text{če (1)}\{_{TopicP}[_{NP} \text{knigata}]_i\} (2)=sŭm=mu=ja (3) \underline{\text{bil dal}} t_i]$. (Bg)

The degree of acceptability of the order Comp–[XP]–CL–V varies across Slavic languages, often within one and the same language (for the discussion of the situation in Cz see VESELOVSKÁ (1995) and HANA (2008)). In most cases, sentences like (15) are communicatively marked and can be explained in terms of fronting: topicalized or focussed constituents undergo XP-movement.

2.8 Tobler-Musaffia's Law, 2P-clitics and VA-clitics revisited

We put forward the claim that the description of word order systems of clausal clitics should be based on syntactic constraints and be maximally independent from conjectures about restrictions imposed by allegedly purely phonetic or lexical properties of clitics. Such “phonetic” or “lexicalist” hypotheses often introduce syntactic information in a disguised shape. The notion of strict encliticity is just one issue. A strict enclitic is an element that cannot be fronted and does not appear at the left margin of its domain. For clausal strict enclitics such a domain is the clause. In Romance and Slavic studies, strict enclitic effects are described as resulting from Tobler-Musaffia's Law (TM Law). TM Law is usually explained as a PF requirement excluding strict enclitics from the clause-initial position (cf. FRANKS 2008:93). It is desirable to explain the presence of overt PF material before Slavic clausal clitics non-syntactically since it is a simpler explanation than the alternative hypothesis about XP-movement. However, virtually all Slavic languages that impose a constraint on the number of constituents preceding 2P pronouns and auxiliaries occasionally allow the placement of these clitics after a prosodic break – clause-initially or after a parenthetical insertion: this is attested, e.g. in Bg (MIŠESKA TOMIĆ 2004:214, FRANKS 2008:100), Slv (KOSTA 2009) and Cz (AVGUSTINOVA & OLIVA 1997:33, ČAVAR & WILDER 1999:438). SC seems to be the only Slavic language where this is strictly impossible (RADANOVIĆ-KOČIĆ 1996:439). Therefore, one needs to postulate two kinds of TM-clitics: allegedly phonetic (SC) and allegedly syntactic clitics (Cz, Bg, Slv and other languages) – obviously not a desirable result.

Another controversial issue is the nature of the verb-adjacent clitics (VA-clitics). This category has been postulated to explain the properties of Bg and Mac pronominal and auxiliary clitics which take adjacent position to verbal forms / lexical heads of a nominal predicate (cf. examples (9)–(12)). But Bg and Mac pronominal and auxiliary clitics also have a fixed position in the clause: all Bg clitics stand in clausal 2P (with the basic word order without Barriers), while Mac pronominal and auxiliary clitics take 1P/2P. Therefore, Bg and Mac pronominal and auxiliary clitics are VA-elements and 2P ~ 1P/2P elements at the same time. This gives rise to different theories. DIMITROVA-VULCHANOVA (1999) assumes that Bg and Mac are just modified systems with 2P ~ 1P/2P clitics with a superimposed constraint on clitic-and-verb adjacency. FRANKS & KING (2000:48–67) argue that Bg pronominal and auxiliary clitics are phonetic enclitics but syntactic proclitics, while Mac pronominal and auxiliary clitics are both phonetic and syntac-

tic proclitics: syntactic proclitics are elements left-adjoined to V^0 or VP .²² It is indeed desirable to pattern Bg and Mac together, since the Mac system looks like a variant of the Bg system with a canceled TM requirement: one can also claim that the Bg system is a variant of the Mac system with an added TM requirement. Whatever analysis is chosen, the differences between Bg and Mac word orders can be explained by the hypothesis that these languages operate with different types of clitics. However, the relation of the Bg/Mac subtype to the main Slavic subtype without clitic-and-verb adjacency is obscured: it is unclear what is deviating in the Bg and Mac word order: is it the behavior of clusterizing clitics allegedly excluded from 2P and located in the verbal complex, or is it the behavior of verbal heads left- or right-adjoined to clusterizing clitics obtaining a fixed position in the clause. Consequently, we see no reason to ascribe apparent differences in syntactic structure to alleged differences in phonetic and/or morphological status of Bg/Mac vs. Common Slavic 2P clitics.

From a syntactic point of view, Slavic clusterizing clitics can be classified into four types. We ignore purely prosodic factors such as (im)possibility of clitic placement after a prosodic break and account only for the orientation of clitics towards their hosts and for the possibility of clitic fronting.

- (i) Strict enclitics = TM clitics. Fronting of clusterizing clitics is impossible in any context: SC, Bg, Cz, Svk, ONR, Sinevir dialect.
- (ii) Mild enclitics. Fronting of clusterizing clitics is only possible in communicatively marked contexts, otherwise it is excluded: Slv.
- (iii) Mild proclitics or universal clitics. Fronting of clusterizing clitics is possible or obligatory in communicatively neutral contexts: Mac.
- (iv) Strict proclitics. Procliticization to finite verbs is generalized, enclisis configurations are excluded: Moliseslav (KOSTA 2009).

The hypothesis of special properties of VA-clitics is strengthened by the observation that Bg and Mac are the only two modern Slavic languages with possessive dative clitics in DP. These languages also developed an article system, so the distinction of VA-clitics vs. 2P-clitics may correlate with the DP/NP distinction. However, the patterning of verb-adjacency, DP/NP distinction and possessive dative clitics is unclear: OCS and OR lacked verb-adjacency but had possessive dative clitics.

²² One can also postulate other sites as base generation positions for VA-clitics or even treat them not as standard clitics subject to head movement, but as agreement markers incorporated in the verbal complex.

3 Barrier Theory and derived word orders with clitics

The basic word order in Slavic sentences with clusterizing clitics is not realized automatically. There are two main deviations from the basic order #XP–CL that must be classified with derived orders: a) late placement of clusters, b) splitting. Under a), the whole clitic cluster ends up to the right of clausal 2P. Under b), some clusterizing clitics remain in clausal 2P, while other clusterizing clitics end up to the right of it. These two configurations are not restricted to Slavic languages and are widely attested in other world's languages with 2P clitics (cf. HALPERN (1996)). Numerous explanations of a) and b) exist, but Barrier Theory introduced by ZALIZNJAK (1993:287) and modified in ZIMMERLING (2002:88, 2009) is the only theory, which explains late placement of clusters and splitting by one and the same underlying mechanism. The main hypothesis is that the sentence-initial group / lexical head hosting the clitics may have properties of a Barrier and move all or some clusterizing clitics to the right of clausal 2P. The first option is referred to as 'blind' or 'indiscriminating' Barrier, the second option is referred to as 'selective' Barrier (ZIMMERLING 2009). Barrier effects or 'Barrier Rules', in terms of ZALIZNJAK (2008), are also attested in languages with VP-internal clitics, where they map configurations with verbal enclitics onto configurations with verbal proclitics or vice versa: ROUVERET (1999) argues it is the case in European Portuguese main and embedded declaratives. In languages with clausal 2P clitics Barrier Rules do not change the orientation of clitics but invariably shift all or selected clitics to the right of clausal 2P. In a general form, the notion of a Barrier is rendered in (xi) and (xii):

- (xi) A Barrier is a syntactic category (a lexical head or a phrase) taking effect on the position of clitics. It can change the orientation of a clitic towards the clitic host or move a clitic in a given direction *n* steps to the right /left of the clitic host.
- (xii) In 2P languages sentence-initial Barriers are either blind and move all clusterizing clitics *n* steps to the right of clausal 2P or selective and split the clusters by moving some clusterizing clitics *n* steps to the right of clausal 2P.

3.1 Blind and selective Barriers

The late placement of the entire cluster caused by a blind Barrier is shown below in (18) and (19), the splitting of a cluster is shown below in (20) and (21). We specify the lowercase/uppercase indexes for selective Barriers in order to show,

which clitics they take effect on, and use curly brackets to specify the communicative status of the Barrier category.

- (18) #[**BARRIER**_{TopicP [PP **V nedoborexъ**]}] plati=*mi=s'a* životinoju (Birch barch letter 463, XIV century). (ONR)

In shortage_{LOC.PL} pay_{IMP.SG} me_{DAT.1SG} REFL_{ACC} livestock_{INSTR.SG}.
'In case of shortages, you must pay me with livestock.'

- (18')*_{{TopicP [XP]}-CL} ⇒ #[**BARRIER**_{{TopicP [XP]}-Y-CL} (Common Slavic)

- (19) #[**BARRIER**_{TopicP [NP **Husté čierne vlasý**]}] kaderili =*sa=mu* za ušami. (Svk)

Thick_{NOM.PL} black_{NOM.PL} hair_{NOM.PL} curl_{PRF.3PL} REFL_{ACC} him_{DAT.3SG.M}.
behind ear_{Instr.PL}
'His thick black hair curled behind the ears.'

- (20) [**BARRIER**_{a {TopicP A [PP **ou koroleva**]}}]=*esi^b* muzha
And from king's_{GEN.SG} BE_{AUX.PRS.2SG} man_{GEN.SG}
slyshalъ=*li^a* (OR)

hear_{PRF.2SG.M} Q
o tomъ čstnomъ krstě?
about that_{LOC.SG.M} worthy_{LOC.SG.M} cross_{LOC.SG.M} (Ipat., under 1152 AC, list 166 rev.).
'Haven't you heard about that worthy cross from the king's man?'

- (20')*_{{TopicP [XP]}-CL^{a+b}} ⇒ #[**BARRIER**_{a {TopicP [XP]}-CL^b-Y-CL^a} (Common Slavic)

- (21) [**BARRIER**_{1 a {TopicP [NP **Knigata**]}}] [**BARRIER**<sub>2 a {FutP **šte**}]]=*si^b=ja^c pročel*=

3.2 Communicative and grammaticalized Barriers

Both blind and selective Barriers can be optional and obligatory. Another distinction relevant to the typology of Barriers is the distinction between communicative and grammaticalized Barriers. Communicative Barriers are phrases that affect the position of clitics due to the communicative status they acquire in a given

sentence, e.g., initial NPs and PPs in (18)–(21) are topics. Grammaticalized Barriers are particular lexical heads or formal parameters of phrases that affect the position of clitics irrespective of the communicative semantics of the sentence, wherever they occur. E.g., in the ONR system each initial multi-word group consisting of two or more stressed word forms was an obligatory grammaticalized Barrier: $*\#[_{XP} W^1W^2]-CL \Rightarrow \#[BARRIER \ [_{XP} W^1W^2]-Y-CL$. In the Croatian variety of modern SC the initial multi-group consisting of three stressed word forms is an optional grammaticalized Barrier (cf. (22a–b)).

- (22) a. $^2[_{NP} \text{Tu novu pojedinost}] =sam$
 [This_{ACC.SG.F.} new_{ACC.SG.F.} detail_{ACC.SG.F.}] BE_{AUX.PRS.1SG.}
saznao
 discovered_{PRF.3SG.M.} četvrtog dana ujutro
 fourth_{GEN.SG.M.} day_{GEN.SG.M.} in-morning
 ‘This new detail I discovered on the fourth day in the morning.’
 b. $[BARRIER \ [_{NP} \text{Tu novu pojedinost}]] \text{ saznao} =sam \text{ četvrtog dana ujutro.}$

Bg *šte* in (21) or Bg negation *ne* are obligatory grammaticalized selective Barriers for the particle *li* but not for other clusterizing clitics.²³ Mac negation *ne* is a selective grammaticalized Barrier too: it moves pronominal clitics to the right and leaves them outside the cluster but does not affect the position of auxiliary clitics (DIMITROVA-VULCHANOVA 1999:103).

3.3 Barriers and Verb Movement

Splitting of a cluster usually cannot be accounted for in non-syntactic terms – it is not conceivable that a contact string of prosodically uniform clusterizing clitics, which is preserved intact in one group of contexts, has been split in other contexts for purely phonetic reasons. Some cases of late placement can be explained both syntactically and phonetically – one could, e.g., claim that in (18)–(21) there is a prosodic break after the initial topical phrase, and that that is the actual reason that Slavic clitics in (18)–(19) do not adjoin to the first constituent and ‘skip’ it as

²³ Bg is the only Slavic language where grammaticalized selective Barriers (*ne* and *šte*) leave the clitic they take effect on (Bg *li*) in the same phonetic word by inverting its position in it: Bg $*[BARRIERa \ [XPX]] = a \ b \ c \Rightarrow [BARRIERa \ [XPX]] = b \ a \ c$. Cf. Bg $*Ne=li=si \ xodil \ tam? \Rightarrow [BARRIERa[NegPNe]]=sib \ =lia \ xodil \ tam?$

a bad clitic host.²⁴ However, the hypothesis about prosodic breaks as the driving force of late placement fails to explain a peculiar fact: in Slavic examples exhibiting late placement (18)–(19) and cluster splitting (20)–(21), those clusterizing clitics which are found to the right of clausal 2P are immediately preceded by verbal forms. In other words, clause-initial communicative Barriers both prevent clusterizing clitics from taking their canonical position, clausal 2P, and attract Slavic verbs to 2P or to a position resembling 2P. With the basic word order XP–CL, Slavic verbs lack a fixed position in the clause (with the exception of Bg and Mac which constitute a special subclass of Slavic word order systems, see below). In derived word orders with an initial communicative Barrier the position of Slavic verbs is fixed. This mechanism is shown in (xiii).

(xiii) {_{TopicP} [XP]} – CL....V ⇒ [**BARRIER** {_{TopicP} [XP]} [V_i – **CL**]...t_i.

ČAVAR & WILDER (1999) state that the generalization (xiii) holds for Croatian root declaratives and argue that (xiii) instantiates verb raising to clausal 2P, a mechanism that cannot be explained prosodically.²⁵ ZIMMERLING (2002:88) demonstrates the same on a sample of Slavic languages, both modern and old ones. Although Čavar & Wilder do not apply the notion of Barrier, their analysis of ‘clitic-third’ configurations is largely equivalent to the approach outlined here. In this analysis, the initial constituents acting as Barriers are not extraclausal: consequently, the target of the verb movement in (xiii) is not the clause-initial position, but clausal 2P or some sentence-internal position overtly looking like 2P, with a single constituent preceding it. Contrariwise, Zaliznjak’s version of the Barrier theory (ZALIZNJAK 1993:286, 2008) patterns with ANDERSON (1993) and HALPERN (1996) in treating initial Barriers as extraclausal material located outside the clitic domain: consequently, the clitics are declared remaining in 2P in all cases, and no hypotheses on verb movement and clitic movement are needed. This straightforward analysis does not capture the fact that no Slavic language including Bg and Mac has grammaticalized constraints on verb placement in **sentences without clitics**: such constraints arise (with the exception of Bg and Mac, where the verb must take adjacent position to the clitics under the basic order XP–CL) only in derived structures with a Barrier.

²⁴ Note that ‘skipping’ analysis in the spirit of ANDERSON (1993) fails to explain the phenomenon of cluster splitting in (20) and (21): some clusterizing clitics skip the allegedly ‘bad’ host, whereas other clusterizing clitics adjoin directly to it.

²⁵ The hypothesis of Prosodic Inversion as a last resort verb movement, its only motivation being the need to host 2P enclitics and remove them from the clausal left margin, is not applicable here, since there is an initial topicalized phrase before the verb.

The main clause Barrier Rule shown in (xiii) is uniform across Slavic languages but they differ in the type of Barriers allowed in a given type of clauses. E.g. Bg allows initial topical Barriers only in interrogative clauses like (21) but not in main clause declaratives, where the basic word order #XP-CL-V ~ #V-CL is obligatory.

3.4 Barriers and clitic movement

From the viewpoint of formal typology, the hypothesis of clitic movement in derived structures with a Barrier proceeds from the hypothesis of verb movement in these structures. Since the latter hypothesis is probable, the assumption that Slavic clusterizing clitics move and change their position in the derivation of structures with a Barrier is justified. For the sake of space, we will skip the discussion, whether tentative clitic movement in structures like [XP]-CL....V $\Rightarrow$ [**BARRIER** [XP]-[V_i-CL]...t_i] should be analyzed as non-canonical left-to-right movement, i.e., clitic lowering in the derived structures with a Barrier, or as canonical right-to-left movement, clitic raising in the basic structures without a Barrier. Whatever variant is chosen, we deal with overt PF-movement: the clitic(s) effected by a Barrier leave(s) the first phonetic word²⁶ and ends up in the second/*n*th phonetic word, where it adjoins to a verbal head. There is one deviation from this pattern, namely, the behavior of the Bg particle *li* which is the leftmost clitic in the cluster: *li* cannot adjoin to the negation *ne* and the future operator *šte*, but does not leave the first phonetic word and invert its position in it; instead, see the underlying order generated by the Template Principle in (23b) vs. the derived order in (23c).

- (23) a. jade =*im* =*se*. (Bg)

 ‘They are hungry.’
- b. Jade =*li* (1) =*im* (2) =*se* (3)? (Bg)
 Eat.PRS.3SG. Q they.DAT.PL. REFL.ACC.
 ‘Are they hungry?’
- c. [**BARRIER**_a [NegP **Ne**]] =*im*^b (2) =*li*^a (1) =*se*^c (3) jade? (Bg)
 Not.PRCL they.DAT.PL. Q. REFL.ACC. eat.PRS.3SG.
 ‘Aren’t they hungry?’

²⁶ Under the copy-and-delete approach, this initial position/entry of the clitic is identified as the ‘higher copy’, while the target position in the VP is identified as the ‘lower copy’.

- d. ***Ne**=**li**^a (1)=**im**^b (2)=**se**^c (3) **jade**? (Bg)
 ***[BARRIER_a [X_{NP}X]]** = CL ^a + ^b + ^c ⇒ **[BARRIER_a [X_{NP}X]]** = CL ^b + ^a + ^c

There are numerous accounts of this typologically rare behavior of Bg *li* (cf. the analysis in terms of Prosodic Inversion in KING (1997) and FRANKS (2008:97)). We still think that an explanation in terms of Barriers is possible: *ne* and *šte* are selective Barriers for Bg *li*, but not for other clusterizing clitics.²⁷ If a syntactic analysis of the interaction of *li* with *ne/šte* is chosen, we must, however, admit a mismatch of the syntactic and the prosodic aspect of clitic movement: *li* leaves its canonical slot in the template (cf. (23b)) which is a proof for clitic movement,²⁸ but does not reach the postverbal position in the next phonetic word, which suggests that verb movement did not take place. We will make an attempt to reconcile this puzzle with the movement analysis in section 5 below.

3.5 Multiple Barriers and blocking of Barrier effects

At least three modern Slavic languages – SC, Svk and Bg – developed a constraint on the combination of Barriers. In these languages the effect of a single initial Barrier with clitic movement may be cancelled when a second phrase with Barrier properties is added. We cannot go into detail here but just state that this mechanism is language-specific and may not appear in some Slavic languages. For the data, see ČAVAR & WILDER (1999:452–453) and ZIMMERLING (2002:88). Typological parallels from languages with VP-internal clitics can be found in ROUVERET (1999:641).

²⁷ Bg *ne* and *šte* are clitics too, though of a different kind than *li*: they can be both sentence-initial and sentence-internal. They can be identified as proclitics or universal clitics. Note that if one clitic, e.g., Bg *ne* or *šte* has Barrier properties and takes effect on the surface position of a different clitic, e.g., Bg *li*, this proves that they do not belong to the same cluster. The same analysis may be extended to Mac negation *ne* and, arguably, future operator *ќе*, if these operators take effect on the placement of Mac pronominal clitics, cf. Mac ***Ne**=**se** *bespokojte* ‘Do not worry!’ ⇒ **[BARRIER_{Negp}Ne]** *bespokojte*=*se*. This syntactic test is important, since Mac *ne* and *ќе* have nearly the same prosodic properties as Mac pronominal and auxiliary clitics.

²⁸ Unless Bg *li* is denied a slot in the cluster – a solution that lacks independent justification.

4 Slavic word order systems

Following ZIMMERLING (2006), we classify all Slavic word order systems into 4 types tagged W-systems, W^+ -systems, W^* -systems and C-systems. The definitions follow below. The symbol 'W' stands for 'Word' or 'Wackernagel', ' W^+ ' stands for 'modified Wackernagel', ' W^* ' stands for 'degraded Wackernagel', 'C' stands for 'communicative'.

4.1 Standard W-systems

- Language L is a standard W-system if the placement of clusterizing clitics to clausal 2P is the most grammaticalized constraint on word order.

Slavic languages of this type are SC, Burgenland Croatian (BROWNE 2007), Slv, Vojvodina Rusinsky (BROWNE 2008), Cz, Svk, ONR, and Sinevir dialect. W-systems are found in various areas in different language families. The first W-system discovered was Old Greek; its first explicit description was given by Jacob WACKERNAGEL (1892). Other W-systems in the Indo-European family are Avestan, Sanskrit (HOCK 1996), Hittite and Luwian (Anatolian), and Ossetian and Pashto (Iranian). W-systems in non-Indo-European languages are, e.g., Kabile Berber (Afro-asiatic), Warlpiri and Djaru (Pama-Nyungan), Lummi (Salish, cf. JELINEK 2000), Makah and Ditidaht (Wakashan, cf. WERLE 2002), Quiavini Zapotec (Otomangean, cf. LEE 2000), Cavineña (Tacanan, cf. GUILLAUME 2008).

4.2 W^+ -systems

- Language L is a W^+ -system if its most grammaticalized constraints on word order put clusterizing clitics into a fixed position and locate verbal forms in positions adjacent to the position of clusterizing clitics.

Slavic languages of this type are Bg and Mac. In W^+ -systems of the Bg/Mac subtype the position of the verb/nominal predicate is fixed if clusterizing clitics are present and not fixed otherwise. The clitics take 2P (Bg) or 1P/2P (Mac) and attract verbal forms to adjacent positions. The Bg W^+ -system conforms to formula (xv):

(xv) # XP-[CL-V] ~ #[V-CL]; #..... V....# (Bg)

The Mac W^+ -system conforms to formula (xvi).

(xvi) # XP-[CL-V] ~ #[V-CL] ~ #[CL-V]; #..... V....# (Mac)

An exact parallel to the Bg W^+ -system is provided by the Central Philippine languages Tagalog, Bikol and Cebwano: all of them conform to formula (xv), as demonstrated in BILLINGS & KONOPASKY (2002).

W^+ -systems of a different subtype combine the constraint on the placement of clitic clusters with the Verb-second constraint or the V2/V1 constraint. Such word order systems are attested in Old Nordic and Middle Norwegian (ZIMMERLING 2008: 210–215) and, according to some descriptions, in Old French. The word order in such systems conforms to formula (xvii):

(xvii) Germanic-type W^+ -system: # XP-[V-CL] ~ #[V-CL]

There is no Slavic language for which formula (xvii) is attested.

4.3 W^* -systems

- Language L is a W^* -system if the principle for placement of clusterizing clitics in clausal 2P is not absolutely restrictive and cooccurs with alternative linearization strategies, which may eventually lead to placement of different types of clusterizing clitics according to different principles.

Typical Slavic W^* -systems are OCS and South OR. Here clusterizing particles take 2P, clusterizing auxiliaries tend to adjoin to V or VP, while clusterizing pronouns may both pattern with particles or auxiliaries (ZALIZNJAK 2008:87–168). Another W^* -system is Polish, a language where BE-auxiliaries normally right-adjoin to V but can clusterize with pronominal clitics in verb-initial clauses. Some clitics, such as the Pol. particle *by*, occur only in subordinate clauses and almost invariably take complementizers as their hosts.²⁹

The most famous subtype of a W^* -system is found in Romance and Balkan languages (cf. French, Italian, Spanish, Catalan, European Portuguese, Modern Greek, Albanian). Here clusterizing clitics (object pronouns and auxiliaries) are located in VP and neither the clitics nor their verbal hosts get a fixed position in the clause (CARDINALETTI 1999). We refer to this subtype as V-systems ('V' =

29 (i) Cf. Pol [CP Gdy =*by* =*m* miał czas]
 If COND BE.AUX.Prs.1Sg. have.Prf.3.SG.M time
 'if I had time'
 (ii) *Gdy [miał] =*by*=*m* czas.

‘Verb’). The only Slavic V-system is Moliseslav (Slavisano), a Croatian variety spoken in Italy (KOSTA 2009).

4.4 C-systems

- Language L is a C-system if it lacks grammaticalized constraints on the placement of sentence categories that are realized automatically with each communicative structure.

Slavic C-systems are Ru, Blr and Ukr. From a diachronic perspective, Slavic C-systems evolve from W-systems (Old Novgorod dialect) or W*-systems (Old South Russian). This evolutionary trend is instructive, since it shows that removal of the 2P condition for clitics does not necessarily involve grammaticalization of other constraints on word order. The 2P condition on the placement of clitic clusters can hold both in languages with constraints on the placement of verbs (Bg, Mac, and other W⁺-systems) and in languages without such constraints (Slavic W-systems and W*-systems).

4.5 The unity and diversity of Slavic word order systems

On a purely descriptive level the terms ‘VA-clitics’ vs. ‘2P-clitics’ are just as good as the terms ‘W-, W⁺-, W*-systems’ introduced here, since they are conventional and telling. Empirically, ‘Slavic W⁺-systems’ equal ‘Slavic word order systems with VA-clitics’, ‘Slavic W-systems’ equal ‘Slavic systems with consistent 2P-clitics’, and ‘Slavic W*-systems’ equal ‘Systems with inconsistent 2P-clitics’. One advantage of our decision to parametrize word order systems with clitics instead of properties of the clitics themselves, is that Slavic languages with clausal clitics can be put into an appropriate typological context, since almost identical systems are attested in other languages. Another advantage is that Slavic systems with clitics can be described solely on the basis of syntactic constraints without sticking to assumptions about PF and LF features of clitics: all one needs to know is that a subclass of clausal elements clusterizes and conforms to three types of conditions/principles: a) the Template Principle; b) Constituency Conditions predicting the choice of Comp/XP as the clitic host under the basic word order and licensing well-formed strings in XP; c) Barrier Rules generating derived word orders with clusterizing clitics.

The underlying unity of W-, W⁺- and W*-systems is revealed by the fact that all of them apply the Template Principle when clusterizing clitics come into contact.

Historically, Slavic W^* -systems evolved from standard W -systems as proven for Old East Slavic by ZALIZNJAK (2008). The skeptics would say that this detail does not clarify the status of clitics in UG. However, the observed facts suggest that the development of all word order systems with clitic clusters in the world's languages conforms to the Principle of Domain Shrinking. It predicts that if a language has clitic clusters in Spec, CP or Spec, IP, at some later stage these clusters can migrate downwards, in terms of McCONVELL (1996), and end up in VP. This amounts to the syntactic shift from standard W -systems to W^* -systems.³⁰ The shift in the opposite direction, i.e., from W^* -systems/ V -systems of the Romance type to standard W -systems, is problematic, since clusters of clause-level clitics do not seem to migrate upwards: if a cluster as a unit is in its entirety generated in VP or some projection above VP but below IP,³¹ it is unlikely that it will raise to any higher projection, be it Spec, CP or a different node. Raising of isolated clitics and other clause-level elements to 2P (whatever the exact definition of this position in UG is), where they adjoin to the already existing clitic clusters is certainly possible – otherwise, Slavic clitic templates could not be expanded with new kinds of auxiliaries, pronouns, and particles. But raising of a complete cluster to a hierarchically higher position in the same clause lacks motivation.

The unity of W -, W^+ -systems vs. W^* -systems is confirmed by the fact that they make use of the same Constituency Conditions for all 2P clitics.³² A further difference is that W^* -systems show a statistically relevant increase of cases where some or all clusterizing clitics stand to the right of 2P³³.

The crucial question is what kind of rules distinguish W^+ -systems with VA-clitics from standard W -systems lacking constraints on verb-and-clitic adjacency. KING (1997:75) and FRANKS (2008:93) claim it is multiple XP-fronting, which attested in Bg and banned in other Slavic languages (cf. examples (16) and (17) above). But since Cz exhibits multiple XP-fronting without verb-adjacency – albeit

³⁰ Cf. the transition from the Common Slavic and Old Polish type of a W -system to the Modern Polish type of a W^* -system.

³¹ ROUVERET (1999) argues this is the case in the European Portuguese V -system with pronominal object clitics.

³² With the exception of the SC particle *li* which cannot appear after initial multi-word constituents and has to adjoin to the first phonetic word, while other clusterizing clitics in SC are placed both after the first phonetic word and after the first spelled-out constituent. Contrariwise, in the Bulgarian W^+ -system *li* normally appears after the first spelled-out constituent. In the ONR W -system all clusterizing clitics including *li* adjoined to the first phonetic word. Therefore, the placement of *li* cannot be used to distinguish the Bulgarian W^+ -system from standard Slavic W -systems.

³³ For statistical figures for the OSR W^* -system see [ZALIZNJAK 2008: 127–128]. Similar results for the early Greek koine W^* -system have been achieved in [KISSILIER 2011: 113–121].

in communicatively marked sentences (AVGUSTINOVA & OLIVA 1997:45, HANA 2008) – while Bg bans several types of multiple XP-movement – notably movement of the groups $*[V_{fin} + O]$, $*[S + V_{fin}]$, $*[V_{fin} + Adv]$, $*[S+O]$ to XP (cf. DIMITROVA-VULCHANOVA 1999:92) – the presence/absence of multiple XP-movement cannot be diagnostic for the distinction between W-systems and W^+ -systems. Our proposal is that W-systems and W^+ -systems differ in the use of Barrier Rules. In standard W-systems (SC, ONR, Svk, etc.) non-initial $[V-CL]$ sequences in the main clauses only arise in sentences with derived word orders: such orders are triggered by a combination of a Barrier Rule and verb movement. A Barrier Rule takes effect on the position of clusterizing clitics and removes them from 2P: if XP is filled by an initial group acting as a Barrier, clusterizing clitics do not reach clausal 2P (ČAVAR & WILDER 1999) or, under different assumptions, move out of 2P (ZALIZNJAK 1993:287, ZIMMERLING 2008:226) and make it available for moved verbs. This gives rise to the configuration $[^{BARRIER} [XP]]-V-CL$. This mechanism is the same in all Slavic languages (cf. examples (18), (19), (22) showing Verb-second orders in ONR, Svk, and SC main clause declaratives).

In the Bg W^+ -system, the sequences $[CL-V] \sim [V-CL]$ arise already with the basic word order. Contrariwise, the structure $*[^{BARRIER} [XP]]-V-CL$ is severely ungrammatical in Bg main clause declaratives, cf. (24).

- (24) $\{_{TopicP} [_{XP} [_{PP} Na Ivan] [_{NP} knigata]]\}$ vŭrⁿal =sŭm
 [To Ivan._M] [book._F]._{DEF.F} return_{Prf.3SG.M} BE.AUX._{1SG}
 =mu =ja.
 he_{Dat.M} she._{ACC.F}
 Intended meaning: ‘I returned the book to Ivan’.
- (Bg)

Therefore, the derived word order in standard W-systems – $[^{BARRIER} [XP]]-V-CL$ – is a mirror image of the basic word order in the Bg W^+ -system – $XP-CL-V \sim [_{XP} V]-CL$. The fundamental difference is that Bg clusterizing clitics do not give up 2P in main clause declaratives but attract the verbs to clitic-adjacent positions: **verbs cannot take** 2P in this type of a W^+ -system, it is reserved for clitics only. Let us parametrize the 2P properties of Slavic clitics and analyze them in terms of feature strength. In these terms, Bg 2P clitics are strong 2P clitics, since they never leave clausal 2P and attract Bg verbs to adjacent positions. Standard Slavic 2P clitics, on the other hand, are weak, since they do not reach clausal 2P in derived word orders with a Barrier and make 2P available for the verb: as a result, Verb-second orders arise.

Finally, the unity of all three types of Slavic systems with clausal clitics and the East Slavic C-systems is revealed by the fact that none of the four systems has grammaticalized constraints on the placement of verbal forms in sentences with basic word order. Therefore, the absence of constraints on the placement of

finite verbal heads / *l*-participles (i.e., past participles used in the complex perfect and plus-perfect tenses) in sentences with basic word order seems to be the most general characteristic of the Slavic syntactic type.

5 Slavic VA clitics as strong 2P clitics: the VA vs. 2P distinction revisited

The Barrier Theory and the notion of strong/weak 2P make it possible to display the distinction of VA-clitics vs. 2P clitics in a new light. The previous approaches elaborated the insight that Bg and Mac VA-clitics are not 2P (en)clitics adjoining to XP, but verbal (pro)clitics lacking a fixed syntactic position in the clause (cf. KING 1997, FRANKS & KING 2000, FRANKS 2008). We argue that Bg VA-clitics are 2P clitics as well, and that they share prosodic as well as syntactic properties of clausal 2P (including XP-movement and licensing of the initial constituents in XP) with 2P clitics in other Slavic languages (SC, Cz, Svk, ONR, etc.). At the same time, strong Bg 2P clitics differ from weak Common Slavic 2P clitics in that they are firmly attached to clausal 2P: the Bg word order system blocks or reduces the possibilities of removing clitics from 2P and imposes stricter constraints on clitic movement and verb movement than other Slavic systems. These constraints have at least four diagnostic features:

1. In sentences with the basic word order #XP–CL–V ~ #V–CL strong Bg 2P clitics attract verbal forms to clitic-adjacent positions, while the distant orders #... CL [...] V, #V [...] CL are banned.
2. Strong Bg 2P clitics do not leave their clause: clitic climbing is impossible in Bg.³⁴
3. Strong Bg 2P clitics do not leave clausal 2P and do not make it available for verbal forms in main clause declaratives (cf. the ill-formedness of (24)).
4. The mechanism of *li*-inversion may be triggered by the requirement to retain all clusterizing clitics in 2P (cf. (23b-d)) and avoid cluster splitting.

The puzzling behavior of Bg *li* is likely to be triggered by a conflict of two mechanisms involved in the Barrier Rule. On the one hand, the fact that *li* in sentences

³⁴ Note that instances of Bg Possessor Raising discussed by WUNDERLICH & SCHÜRCKS (2003) do not falsify the conclusion that Bg clausal 2P clitics do not climb. Under Possessor Raising, DP-level dative possessive clitics optionally raise, leave DP, and take clausal 2P. Cf. Bg *Pročete=li* [_{DP} statja-ta=i] ‘Did you read her article?’ ⇒ *Pročete=li=i* [_{DP} statja-ta t] ‘the same’. Clitic climbing out of IP/CP is impossible in Bg.

with Bg *ne/šte* leaves its slot in the clitic template confirms that [_{NegP} *ne*] and [_{FutP} *šte*] are selective Barriers and indicates that clitic movement and cluster splitting have taken place in (23c). On the other hand, the moved clitic does not reach its target position (right-adjunction to the verb) predicted by the Common Slavic pattern (20') repeated here as (xviii). This apparently indicates that no verb movement did take place in (23c) – a logical result, if the analysis where Bg verbs move to clitic-adjacent positions already with the basic word order XP–CL–V_i...t_i is on the right track.

(xviii) Common Slavic *[**BARRIER**_a [XP]–CL^{a+b+c} ...V ⇒ [**BARRIER**_a [XP]–CL^{b+c}–V_i–CL^a t_i

It is well-known that Bg has retained the Common Slavic pattern (xviii) (cf. (21) above) but its uses are marginalized and require special pragmatic contexts. While example (25b) with *li*-inversion is a real question, example (25c) is permitted only as an echo-question (Schürcks, p.c.).³⁵

(25) a. *Ti ne=[_{CliticP} *li=si=mu*] dal pari? (Bg)

Intended meaning: 'Did you give him money?'

b. Ti [**BARRIER**_a [_{NegP} **ne**]] __ a =si^b=**lia**=mu^c dal pari? (Bg)

'Did you give him money?'

c. ?Ti [**BARRIER**_a [_{NegP} **ne**]] __ a =si^b=mu^c dal=**ti**^a pari? (Bg)

'(Did you really say that) you gave him money?!'

In a similar way, blind communicative Barriers of the Common Slavic type (20') where the whole cluster is shifted to the post-verbal position are banned in Bg main declaratives (cf. (26a–b)) but permitted in Bg yes-no questions (cf. (27a–b)).

 deceased
 ‘Was there water in the lungs of the deceased person?’
- b. **[BARRIER {_{TopicP} [_{PP} V [_{NP} **drobovete na umrelija**]}]]** imalo =li=je voda t_i? (Bg)
 ‘As for the lungs of the deceased man, was there water?’

In Bg interrogative clauses construed with an initial topic, the Barrier Rule is almost obligatory. FRANKS (2008:98) compares the well-formed sentence Bg {_{TopicP} *Kolata*} *prodade=li Petko včera?* ‘Did Peter sell the car yesterday?’ with the ill-formed *{_{TopicP} *Kolata*} =li *prodade Petko včera?* and concludes that *li* “... must be prosodified and linearized before topics are merged”. However, example (27b), where not only *li*, but the whole string of clitics =li=je headed by *li* takes postverbal position, indicates that the clitic cluster with *li* is linearized after the topics are merged. Hence, the Barrier effect observed in (27b) is not fake or epiphenomenal. The clitic *li* takes 2P, if the initial constituent is focal, cf. (23b), (27a), but cannot follow a topical constituent and must move to the postverbal position. The auxiliary clitic =je which takes 2P after initial topics in main clause declaratives, cf. (27a), in yes-no questions patterns with *li* and takes the postverbal position too³⁶.

To sum up: the constraint on clitic-and-verb adjacency grammaticalized by Slavic W⁺-systems (Bg, Mac) in the basic word order XP–CL–V ~ V–CL reduces the number of derived structures, where verb movement and overt PF-clitic move-

³⁶ It can be stipulated that the Bg clitics right-adjoin to the verb in yes-no-questions before the topic is fronted, but this way one could not account for the fact that in Bg main clause declaratives extracausal topics are not permitted at all (cf. the ill-formed (26b)). Hence, the order {_{TopicP} [XP]}–V–CL in yes-no-questions (27b), is unequivocally linked to verb movement, and verb movement has to be triggered by a Barrier Rule, in this case by the Spell-Out of the initial topic.

ment invert the relative order of CL and V in sequences like XP-CL... V $\Rightarrow$ XP-[V-CL]. As a compensation for the lack of initial communicative Barriers in the main clause declaratives (cf. (19), (24)), Bg developed a special parameter licensing multiple XP-movement under the condition that all fronted groups make up a single topical constituent (cf. (16), (17), (26b)).

6 Further problems and perspectives: Possessor raising and NP/DP internal clitics

In the majority of Slavic languages the dative case has possessive uses: these uses are not restricted to pronouns and clitics, but in languages with pronominal clitics productive possessive constructions without HAVE are generally linked to dative clitic pronouns. Dative possessive clitics do not appear in the North-West Slavic area (ONR and probably other related North-West Russian dialects), where the dative possessive construction is from the beginning of the written period replaced by the preposition genitive construction (cf. Ru *u menja estj Y/u menja Y*, lit. ‘at-me is Y’). Across Slavic languages, dative possessive clitics have two typical positions: inside DP/NP, where they do not clusterize, and clausal 2P, where they clusterize. Slavic clausal 2P possessives seemingly take the same slot as dative argument clitics, but it is unclear whether they should be described as the same underlying dative elements, or as syntactic homonyms. WUNDERLICH & SCHÜRCKS (2003) argue for the first solution for Bg, while ZALIZNJAK (2008:35) opts for the first solution for OR. Bg is one of the few Slavic languages where dative possessives may show up on both the DP/NP level as well as the clausal level. If one assumes that *si* in (28a) and (28b) is the same underlying case form, the Raising analysis is necessary, since Bg phrase-level clitics may not appear at the left margin of DP:

- (28)a. Tja nameri =*li*_[DP] užasni-te =*si* greški]? (Bg)
 She found._{PST3.SG.} Q horrible-the. REFL._{DAT} mistakes
 ‘Did she find **her** horrible mistakes?’
- b. Tja nameri =*li* =*si*_i [_{DP} užasni-te t_i greški]? (Bg)
 She found._{PST3.SG.} Q. REFL._{DAT.} horrible-the mistakes
 ‘Did she find **her** horrible mistakes?’³⁷

³⁷ Examples (28ab) and (29ab) are from WUNDERLICH & SCHÜRCKS (2003).

WUNDERLICH & SCHÜRCKS (2003) argue that in (28b) the possessive *si* is raised, while in (29b) the dative possessive *i* is base-generated, since Bg does not have possessive clitics in indefinite NPs (29a):

- (29) a. *Pročeto_x statja =*i*. (Bg)
 Read._{PST.1SG} article her._{DAT.3SG.F}
- b. Pročeto_x =*i* statja. (Bg)
 Read._{PST.1SG} her._{DAT.3SG.F} article
 'I read one of **her** articles.'

However, Possessor Raising out of an indefinite NP is attested in OR. See the phrase-level clitic *ti* 'your'/'to you' in (30) with the clause-level clitic *ti* 'your'/'to you' in (31):

- (30) čto vozdamъ =*ti* [_{PP} protivou [_{NP} blagodějaniju=*ti*?]
 (OR, Ipat. [1199], list 244)

What render._{PRS.1SG} you._{DAT.2SG} for benefaction you._{DAT.2SG}.
 'What shall I render you for **your** benefaction?'

- (31) brata =*ti* Romana Bogъ pojalъ.
 (OR, Ipat. [1180], list 217)

Brother._{ACC.SG} you._{DAT.2SG} Roman._{ACC.SG} God took._{PRF.3SG.M}
 'God took **from you** (your) brother Roman' OR 'God took **your** brother Roman (from you).'

In most Slavic languages the situation is less clear than in Bg or OR. Clause-level possessive clitics may reach clausal 2P, see, e.g., the Svk example (19) repeated here, but the alleged base-generated position of dative possessive clitics in PPs/NPs is filled seldom. Therefore, one lacks an independent verification that Possessive Raising out of PP/NP took place: the 2P dative clitic *mu* in (19) can both interpreted as a base-generated element and as a raised element (which is tentatively assumed in the notation below).

- (19) # [_{TOPICP} [_{NP} Husté čierne vlasy]]] kaderili =*sa*
 Thick._{NOM.PL} black._{NOM.PL} hair._{NOM.PL} curl._{PRF.3PL} REFL._{ACC}.
 =*mu* [_{PP} za [_{NP} ušami t_j]].(Svk)
 him._{DAT.3SG.M}.
 'His thick black hair curled behind the ears.'

In Modern SC, according to a recent study by PENNINGTON (2010), dative possessives in clausal 2P are marginally acceptable, whereas phrase-level dative possessives in SC are ungrammatical. A similar result can be shown for Modern Russian, a language lacking short pronominal clitics. Here, clause-level dative possessive pronouns are marginally acceptable (cf. (32a)), while phrase-level dative possessives are ungrammatical (cf. (32b)).

- (32) a. Ja **sebe** e vrag. (Ru)
 I REFL.DAT. not enemy
 'I am not an enemy **for myself**.'
- b. *Ja vstretil vraga **sebe**. (Ru)
 I met enemy REFL.DAT
 Intended meaning: 'I met **my own** enemy'.

The two earliest attested Slavic idioms – OCS and ONR – exemplify two extremes: ONR completely lacked dative possessives, while in OCS they were common both in clausal 2P and on the phrase-level. OR had phrase-level dative clitics only in clerical and bookish texts, which suggests an OCS influence. These facts seem to indicate that phrase-level possessive clitics are only characteristic for a small group of Modern and Old Slavic dialects: OCS and Bg should be classed with this group. The majority of Slavic languages, i.e., standard W-systems, in terms of this paper, have retained only clause-level possessives, which pattern with argument dative clitics. For this group, the Raising analysis of clausal possessive forms remains controversial.

The majority of Slavic languages, i.e., standard W-systems, in terms of this paper, have retained only clause-level possessives, which pattern with argument dative clitics.

Recently, CINQUE & KRAPOVA (2010) advanced the theory that Possessive Raising is not a homogeneous phenomenon in Bg either. While examples like (28ab) may show clitic movement, in example (33), the clitics seem to be base-generated, since Bg PPs are islands for extraction, as the ungrammatical example (34) shows:

- (33) Toj=**mi** =se izkrjaska [PP v [DP **uxoto**]] (Bg)
 he me.DAT.SG. REFL.ACC shouted.PST.3SG. in ear.the
 'He shouted in **my** ear.'

- (34) *Az= $\dot{\mathbf{i}}$ mislja [_{PP} **za** [_{DP} **očite** t_i]] (Bg)
 I her._{DAT.3SG.F} think._{PRS.1SG.} for eyes.the
 Intended: ‘I think of **her** eyes.’

Cinque & Krapova argue that the crucial difference between (33) and (34) comes about because (33) is *confined to* inalienable possession and available only for predicates imposing a benefactive/malefactive interpretation. (34) is excluded for formal reasons, while well-formed examples like (28b) may express all types of possession and do not impose a benefactive/malefactive interpretation on the possessor.³⁸ This analysis seems to be compatible with the approach outlined here. It is tempting to extend it to other Slavic languages without phrase-level possessive clitics: in this case, sentences like the Svk example (19) can be classified as inalienable possession.

Coming back to the examples (4a–d) repeated here, we would like to propose an alternative derivation for cliticizing into DP in Bg:

- (4) a. stolicata ni // [*stolica ni] (Bg)
 capital._{DEF} our._{DAT}
 ‘our capital’
- b. mladata ni stolica // [*mlada ni stolica] (Bg)
 young._{DEF} our._{DAT} capital
 ‘our young capital’
- c. večno mladata ni stolica (Bg)
 eternally young._{DEF} our._{DAT} capital
 ‘our eternally young capital’
- d. [*večno mlada ni stolica] (Bg)

We³⁹ agree with Cinque & Krapova in that the Dative is underlyingly a Genitive, but we understand it the other way around following KOSTA & KRIVOCHEN (in prep.): Genitive case actually belongs to the Dative sphere, as possession is a form

³⁸ Cinque & Krapova argue that raised possessive clitics that can be extracted out of Bg DPs are underlyingly genitives, while base-generated clitic markers of inalienable possession are underlyingly datives or benefactors/malefactors. This hypothesis needs to be elaborated and tested on the basis of other Slavic languages.

³⁹ This part of the analysis goes back to the theory of Radical Minimalism developed by Diego KRIVOCHEN (2010) and further refined in KOSTA & KRIVOCHEN (2011). We owe much to Diego, who gave us the idea to explain the facts of cliticization into Bg DP by the mechanism of Minimality (RIZZI 2002).

of Location, in which the Figure (in Talmy's terms) is necessarily [+animate]. Furthermore, we claim that in Bg the adjacency of the adjective and the definite article, which is/are thus "jumping over" the possessive, is licensed by Minimality, as defined in Rizzi (2002), which is depicted slightly reformulated below:

(xix) Feature-defined Minimality Principle

A head $X^0 = \{F_1, F_2 \dots F_n\}$ and a head $Z^0 = \{F_1, F_2 \dots F_n\}$ can be related to one another by any syntactic process with respect to a feature F_x from their feature bundle iff there is no Y^0 between X and Z **that has F_x in its feature bundle**. Otherwise, Y^0 is invisible to syntactic processes.

The structure would be as follows:

(35) $[XP [X_{[F_1, F_2]}] [YP [Y_{[F_1]}] [ZP [Z_{[F_1, F_2]}]]]]$

If the relation between X and Z depends on $[F_2]$, then the Y head is invisible with respect to probing purposes. This will be essential for our argumentation.

Assuming this framework, we can derive the Bg structure straightforwardly: let us assume that the adjective head A^0 has an unvalued $[uDef]$ feature, whereas the D^0 head has a valued $[iDef]$ feature. The possessive in between does not intervene in the relation, since the relation is established between $[Def]$ dimensions, and not between categorial features. The tree structure, at the point of the derivation we are focusing on, would look as follows:

The $[Def]$ feature of A is valued, and, as D is not a strong affix (i.e., it cannot stand on its own as an independent phonological word), it adjoins A^0 after Spell-Out, the node with which it has established a relation by means of *Agree*. The categorial feature of Poss is not an intervening feature for *Agree*, following our Feature-defined Minimality.

A note on the possessive would be in order. Why is it spelled-out with dative features? Possession, we assume, is a *central coincidence* relation between a *Figure* and a *Ground*, so that the Relational Semantic Structure of a possessive phrase would be as follows (adapting Mateu's labels to the traditional XP-labeling algorithm):

Further assuming that the Dative Sphere (KRIVOCHEN 2010) is licensed within the P projection, it follows naturally that, if the possessive spells-out the location primitive [WITH], the Vocabulary Item corresponding to that terminal node is a possessive in the (interface-recognized) dative case.

7 Conclusions

The most general characteristic of the Slavic syntactic type is the absence of constraints on the placement of verbal forms in sentences with the basic word order. Slavic word order systems with clusterizing clitics may be described on the basis of syntactic constraints without sticking to hypotheses about language-specific features of clitics. In the Slavic area, only clause-level clitics clusterize. The classification of Slavic languages into subtypes – standard W(ackernagel)-systems, W⁺-systems and W^{*}-systems – can be found in other world's languages, too. With the exception of Bulgarian (Bg) and Macedonian (Mac), which were identified as W⁺-systems in this paper and which grammaticalized constraints on clitic-and-verb adjacency in the basic word order, no Slavic language grammaticalized constraints on the placement of verbal forms in sentences without clitics. In the latter, non-initial [V–CL] sequences arise in derived structures due to a syntactic mechanism defined here as Barrier.

The underlying unity of W, W⁺ and W^{*}-systems is confirmed by the fact that all of them share three types of constraints: the Template Principle, Constituency Conditions, and Barrier Rules. The Template Principle predicts that clusterizing clitics take a contiguous position in a rigid order, according to the types of sen-

tence categories they represent. It makes a syntactic unit out of the clusterizing clitics and puts it into a fixed position defined with respect to the left margin of the clitic domain, i.e., the clause. Constituency Conditions require XP-movement to the pre-clitic/clause-initial position and license the groups hosting XP. Most Slavic languages allow only one maximal projection in XP. Only Bg and colloquial Cz also allow multiple XP-fronting under the condition that the fronted elements make up a single topical constituent. Barrier Rules generate derived word orders with late placement of clitics or with cluster splitting. The Barrier mechanism involves verb movement in root clauses attracting the verb to clausal second position (2P), thus generating the verb-second and clitic-third order XP-[V-CL]. This option is not available in Bg main clause declaratives.

The traditional distinction between Bg/Mac verb-adjacent(VA)-clitics and Common Slavic 2P clitics is justified, but the assumption that Bg VA-clitics lack syntactically relevant features of 2P clitics remains dubious. The type-specific features of Bg VA-clitics can be better captured if one parametrizes 2P properties. Bg VA-clitics are strong 2P clitics: they do not leave 2P and do not make this position available for verbal forms, which blocks derived structures with verb movement. Common Slavic clitics are weak 2P clitics, they move out of clausal 2P and attract verbal forms to it, which triggers the verb-second and clitic-third order XP-[V-CL] in communicatively marked sentences.
