Acknowledgments

The Chicago Linguistic Society would sincerely like to thank the following sponsors for their generous financial support of this year's meeting:

- The Center for Leadership and Involvement
- The Franke Institute for the Humanities
- The University of Chicago Graduate Council

The 58th annual meeting of the Chicago Linguistic Society was held April 22-24, 2022 on the University of Chicago campus. As such, it was the first in-person CLS meeting following the COVID-19 pandemic. We'd like to thank everyone who took part in this event as we navigated the return to in-person functionality.

We are especially grateful to our keynote speakers for presenting their research and to all of the session presenters for sharing their work with us. We appreciate the considerable effort involved in preparing for, traveling to, and presenting at our conference, not to mention the demanding work that their research entails. We are also very grateful to all who submitted an abstract for consideration but did not have an opportunity to present. With a three-day schedule and around 250 submissions, it was necessary to leave out from the program many outstanding pieces of research. If the Chicago Linguistic Society conference maintains high standards, it is due in large measure to the notable authors who submit their work for consideration. Special thanks must also go to the faculty and students in the Department of Linguistics who offered their valuable advice and support from the very first to the very last stages of conference preparation. In addition, we want to express our deep gratitude to all of our anonymous abstract reviewers — external and internal — who provided helpful feedback to submitting authors. Thanks, too, to all the student volunteers who helped us with the conference logistics. Finally, we would like to thank all conference attendees for joining us here at the 58th annual meeting of the Chicago Linguistic Society, continuing the tradition of excellence.

Optionality and variation in Camuno interrogatives: a syntactic analysis

Anda Neagu
York University (Toronto)

1 Introduction

Camuno is a dialect of Eastern Lombard, an endangered language (Moseley, 2010) spoken in Northern Italy in the provinces of Bergamo and Brescia, and the northern areas of the provinces of Cremona and Mantua. As far as Eastern Lombard is concerned, it is spoken North of the La Spezia – Rimini isogloss, which divides the Gallo-Italic group, in the North, from the Italo-Romance group in the South (Biondelli, 1853; Tamburelli & Brasca, 2018). This makes Eastern Lombard a Gallo-Italic variety that presents substantial differences in its syntax when compared to standard Italian, an Italo-Romance variety. When it comes to A-bar phenomena, they are similar to those observed in other Northern Italian vernaculars, such as Veneto. Specifically, its syntax is characterized by a high degree of variation and optionality, two features that also characterize interrogative structures within this variety. This also applies to Camuno, an Eastern Lombard dialect spoken in Valle Camonica, an alpine valley in the province of Brescia. When it comes to interrogative constructions, there are three main strategies available, namely *wh*-doubling, *wh*-fronting, and a clause-internal *wh*P. These strategies display some variation between the North and the South of the valley, with Monnese, a variety from the North, allowing for optionality between the three strategies listed above, and Darfense, a variety from the South, allowing for optionality only between *wh*-fronting and a clause-internal *wh*P.

The article will focus on these phenomena by taking into consideration the relationship with standard Italian, as well as the variation and optionality characterizing Camuno varieties. The next section will take a look at the relationship with standard Italian; section 3 will introduce the data and the main properties associated with Camuno interrogatives, while section 4 will provide an analysis of these phenomena; section 5 is dedicated to a tentative sociolinguistic account of optionality; finally, section 6 concludes.

2 Relationship between standard Italian and local languages

Standard Italian can be defined as the national language of Italy and is based on the Romance vernacular spoken around the Florence area during the Middle Ages (Serianni, 2015). In short terms, at the basis of standard Italian we find the Florentine variety employed in the XIII and XIV centuries by authors such as Dante, Petrarch, and Boccaccio, among others. This vernacular has remained the language of culture in the subsequent centuries, with certain works, notably the *Divine Comedy*, being considered the benchmark of the Italian language and literature (Migliorini, 2001). Because of the historical and literary importance of

this Romance vernacular over the others, the Florentine dialect was chosen as the national language after the Italian unification in 1871. Nevertheless, standard Italian has only started being employed in a more widespread manner around mid-XX century (Berruto, 2017). Despite previous efforts to unite Italy not only politically, but also linguistically, it is only after WWII that those efforts saw some results. Until then, the vast majority of the population would employ their local languages, a tendency that has been reverted in the past decades, with standard Italian substituting the other vernaculars (Berruto, 2017). This process has brought to what has been analyzed as either a diglossic or a multilingual relationship between standard Italian (high code) and local languages (low code) (Tamburelli, 2010).

Today, most speakers employ regional standards, i.e. standard Italian with heavy influences from local vernaculars. This is also the case in the areas in which the data for this project was collected, meaning not only that I had to carefully select the participants for the elicitation task, but also that the data may be affected by the linguistic landscape that was just described. In other words, I believe that part of the data, namely the optionality observed for A-bar phenomena, can be explained not only by recurring to a formal analysis, like the one provided in the following sections, but also by observing the sociolinguistic situation of the area under consideration, in this case Valle Camonica. The following sections, as well as most of the article, will however focus on the formal syntactic analysis of Camuno interrogatives.

3 Data and main properties

The following examples show the two main tendencies in Camuno interrogative patterns: example (1) illustrates interrogatives in Monnese, which allows for wh-doubling (1c), as well as clause-internal whPs (1b) and wh-fronting (1a); while example (2) illustrates interrogatives in Darfense, which only allows the latter two strategies, i.e. wh-fronting (2a) and a clause-internal whP (2b).

(1) a. ‘Ngo l’ e-t vist? (Monnese)
where CL.3SG have.PRES=CL.2SG seen

b. L’ e-t vist ngont ?
CL.3SG have.PRES=CL.2SG seen where

c. ‘Ngo l’ e-t vist ‘ngont ?
where CL.3SG have.PRES=CL.2SG seen where
‘Where did you see him?’

(2) a. Quando l’ e-t ciapada?
when CL.3SG have.PRES=CL.2SG got

b. L' e-t ciapada quando?
 CL.3SG have.PRES=CL.2SG got when
 'When did you get it?'

c. Te mete-t do ke?
 you put.PAST=CL.2SG down what
 'What did you plant?'

Let us start by focusing on the word order in these interrogatives, which is a first indicator of the syntactic distribution of the *wh*-elements. Examples (1a) and (2a) pattern together in that the *whP* is fronted, thus appearing at the beginning of the interrogative. This is followed by an object clitic, which in turn precedes the auxiliary verb, to which the subject clitic is cliticized in an enclitic configuration. Finally, the subject is followed by the past participle. The difference with (1b) and (2b; 2c)¹ resides in the fact that, in this case, the *whP* is clause-internal, instead of fronted, thus appearing after the past participle in terms of linear order. As far as doubling constructions (1c) are concerned, these behave similarly, with the peculiarity of spelling-out two *wh*-items: one fronted and one clause-internal. In sum, in Camuno interrogatives, the *wh*-items may occupy a fronted position, a clause-internal one, or both, depending on the variety and whether or not it allows for the doubling strategy altogether. It is also interesting to notice, however, that the inflected verb also raises, with the clitic subject attaching to it enclitically.

The examples in (1) and (2) also illustrate the general tendencies in interrogative patterns that can be found in Camuno. In particular, example (1) shows that the doubling strategy also presupposes *wh*-fronting and a clause-internal *whP*; example (2), on the other hand, indicates that a clause-internal *whP* also presupposes *wh*-fronting. This, however, tends to apply to adjunct *whPs* (2a; 2b), while argument ones (2c) tend to favour the clause-internal distribution with a hypothetically fronted one being perceived both by the linguistic consultants and the author as a more Italianized version.

Lastly, only certain *wh*-categories allow for doubling, even in varieties where this strategy occurs. In particular, in the case of Monnese, doubling is only possible with the argument *whP* *ke/kwé* 'what', and the adjunct *whP* '*ngo/ngont* 'where'.

Now that the main distributional patterns of *wh*-items have been looked at more attentively, I will switch the focus on the main properties of these constructions. First of all, there is a rigid distribution of the *wh*-elements when there are two forms, such as in doubling structures. This can be observed below in example (3):

(3) a. 'Ngo se-t nasciut 'ngont ? (Monnese)
 where be.PRS=CL.2SG born where

¹ Example (2b) also includes a fronted, phonologically independent subject, in addition to the cliticized one.

‘Where were you born?’

- b. *’Ngont se-t nasciut ‘ngo?
 where be.PRS =CL.2SG born where
 ‘Where were you born?’

Example (3) shows that the two wh-items in a doubling construction cannot be freely ordered, so that the shorter form appears clause-internally and the longer one appears fronted, as in (3b). The only acceptable word-order involves a fronted shorter form, and a clause-internal longer form. I take this to mean that the two wh-elements each play a different syntactic role within the sentence, as it will be better shown in section §4.

Another property worth mentioning has already been introduced earlier in this section, and it involves the presence of subject-clitic inversion. This can be observed in all the direct interrogatives in the previous examples: the subject clitic attaches enclitically to the inflected verb. What may appear, at a first glance, as an inflectional morpheme, has been extensively analyzed as a subject clitic attaching at the end of the verb (Benincà et al., 2016).

Finally, as far as the clause-internal wh-element is involved, this is required to be right-adjacent to the lexical verb, as observable in the following interrogatives involving ditransitives (4):

- (4) a. K’ e-t dat kwé a Paolo al sera? (Monnese)
 what have.PRS=CL.2SG given what to Paolo the evening
- b. *K’ e-t dat a Paolo kwé al sera?
 what have.PRS =CL.2SG given to Paolo what the evening
 ‘What did you give to Paolo yesterday evening?’
- c. E-t te scrit a ki esta letera se bé ?
 have.PRS =CL.2SG you written to whom this letter so well
- d. *E-t te scrit esta letera a ki se bé ?
 have.PRS=CL.2SG you written this letter to whom so well
 ‘To whom did you write this letter so carefully?’

Example (4) shows that interrogatives are grammatical only when the clause-internal wh-item surfaces right-adjacent to the lexical verb, as in (4a) and (4c). It does not matter whether the whP is the direct or the indirect object: whenever their final landing site is clause-internal, it must follow the lexical verb in a right-adjacent position. This becomes even clearer when looking at ditransitive constructions in declarative clauses, where the direct and indirect object can be freely reordered, as observable in (5):

- (5) a. L’ a dat a Paolo esta letera. (Monnese)

CL.3SG have.PRS given to Paolo this letter

- b. L' a dat esta letera a Paolo.
 CL.3SG have.PRS given this letter to Paolo
 'S/he gave Paolo a letter.'

Having introduced the syntactic patterns of Camuno interrogatives and their main properties, the next sections will be dedicated to the analysis of these structures and the evidence supporting it.

4 Analysis

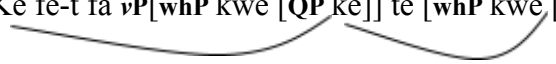

The analysis I propose for these constructions relies on the concept of partial copying, as introduced by Barbiers et al. (2008; 2010), who apply this analysis to non-identical doubling in Dutch dialects. A first difference between my analysis and this is the fact that, while the authors apply this analysis to long-distance dependencies, I will mostly focus on canonical interrogatives. That is, the author is aware of and acknowledges the main differences between Camuno interrogatives and the same constructions in Dutch. Furthermore, the main idea I adopt from Barbiers et al. (2008; 2010) is that partial copying targets a specific node of a layered nominal projection. Thus, given the structures observed so far for the doubling configuration, I suggest the following steps in the derivation:

1. the two *wh* elements enter the derivation as a layered XP: [**whP** kwé [**QP** ke]].
2. partial copying targets only the operator portion [**QP** ke], which raises to the CP.
3. the restriction [**whP** kwé] is realized as an intermediate copy stranded at the edge of *vP*.

This analysis, however, does not only apply to the doubling constructions, but also to the ones involving *wh*-fronting and a clause-internal *whP*. In particular, I suggest that optionality arises when only one element is pronounced at PF, while the other stays silent, being only interpreted at LF. In other words, I suggest that a unified account of the three strategies introduced thus far is possible, and that both the fronted and the clause-internal *wh*-elements are always interpreted by the semantic component.

My analysis relies on the concepts of successive-cyclicity and phasal boundaries. In other words, Camuno *wh*-items occupy phasal boundaries after undergoing successive-cyclic movement to these areas. Phases, in this case CP and *vP*, are cyclic points of transfer to the interfaces (Chomsky, 2008). As such, the elements constituting the phasal domain that do not want to be transferred to the SEM and PHON components, employ the phasal boundary as an escape hatch (Chomsky, 2001). These phasal boundaries are often occupied by operators, such as *whPs*, among other elements, and have been analyzed as being more or less

detailed depending on the theoretical framework one adopts. According to Cartographic approaches (Rizzi, 1997; Cinque, 1999; Belletti, 2004), these domains are highly articulated, with different functional projections hosting syntactic material. Minimalist approaches, on the other hand, tend to rely on the concept of multiple specifiers (Chomsky, 2008; Boeckx, 2012). Whichever framework one adopts, a core concept stands: the object of the phasal projection needs to be transferred to the interfaces, and the *wh*-items whose final landing site is outside of the domain of the phase in which they *e*-merge, need to make use of the escape hatch offered by the phasal boundary. These are the main theoretical premises I rely on for the analysis outlined previously in this section, and whose derivation follows the following steps:

(6) CP[Ke fe-t fa *ν*P[*wh*P kwé [QP ke]] te [*wh*P kwé [QP ke]]]?

I analyze both *ke* and *kwé* as being part of the same A-bar chain, with the fronted element being analyzed as the operator, and the clause-internal one as the restriction of the chain². I thus suggest that a unified analysis is possible, and that, in doubling constructions, both *wh*-elements are phonetically realized, in *wh*-fronting interrogatives only the operator is spelled out, while in “clause-internal structures” it is only the restriction that is overtly realized. The elements lacking phonological content are interpreted at LF. The following section focuses on the evidence supporting this analysis.

4.1 Evidence

The first piece of evidence confirming the syntactic position of the fronted element comes from subject-clitic inversion structures. In these constructions, the inflected verb has been argued to raise into C (see Poletto, 1993 for Northern Italian dialects and Rizzi & Roberts, 1989 for French). This can be observed in example (7), where the operator is followed, in terms of linear order, by the verb to which the subject-clitic is attached. Given this premise, if the inflected verb occupies C, then the *wh*P also occupies a position within this functional field, i.e. spec,CP.

(7) Ke fe-t fa kwé te? (Monnese)
 what do.PRS=CL.2SG do what you
 ‘What are you doing?’

Another piece of evidence comes from the syntactic distribution of the restriction, which has been shown to occupy a position right-adjacent to the lexical verb. The latter, which raises from V into C when finite, raises as far as the IP domain when

² A similar approach to doubling has been adopted by Beck (1996) and Miyagawa (2004) to describe doubling in German interrogatives.

a past-participle. This can be especially observed in the presence of an aspectual adverb, which has been argued to be low in the IP domain (Cinque, 1999), as in (8). Once again, if the verb occupies a position within the IP domain, and the restriction must be right-adjacent to it³, the restriction has then raised at the edge of *vP*.

- (8) Al beker l' ha dat amò ke a la hfëta? (Darfense)
 the butcher CL.3SG have.PRS given again what to the girl
 'What did the butcher give again to the girl?'

A third behavior that constitutes evidence for my analysis is sensitivity to islands, as in (9). In particular, I take the impossibility to form canonical negative interrogatives as an indication that the NEG operator constitutes a barrier (Cinque, 1990; Rizzi, 1990) that blocks "communication" between the operator and its restriction, thus indicating that these two elements are part of the same A-bar chain.

- (9) a. *Ke fe-t miga majà kwé? (Monnese)
 what do.3SG.PRS=CL.3SG NEG eaten what
 'What hasn't he eaten?'
 b. *Maje-la mia ke la ho hpuda? (Darfense)
 eat.PRS=CL.3SG NEG what the his wife
 'What doesn't his wife eat?'

Finally, the element analyzed as the operator portion functions as an operator in other A-bar dependencies, as shown in the free relative clause in (10). I take this to indicate that this is indeed the operator portion of the A-bar chain in interrogative constructions as well, and that the remaining wh-item does not possess this quality.

- (10) Varda 'ngo te mete-t i pé. (Monnese)
 look.IMP where you put.PRS=CL.2SG the feet
 'Watch where you're walking.' (lit. 'Look where you put the feet.')

To sum up the analysis, it was shown that wh-elements occupy phasal boundaries in Camuno interrogatives. In particular, they undergo successive-cyclic movement through the *vP* and the CP phasal domains, with the restriction being stranded at the edge of *vP*, and the operator raising into spec,CP.

5 A note on optionality

³ Only certain adverbials and discourse particles can intervene between the lexical verb and the whP.

Successive-cyclicity has been argued to concern not only long-distance dependencies, but also less complex constructions (van Urk, 2020), such as the structures under consideration. In particular, if on the right track, this analysis, together with the Camuno data constitute further evidence supporting theories of A-bar movement as phasal and successive-cyclic.
