

A New Analysis of the Morphological Structure of Japanese Verbal Adjectives

Shinya Makino

itakanro@g.ecc.u-tokyo.ac.jp

Abstract:

The present paper reanalyses the morphological structure of Japanese verbal adjectives (VAs) — simply adjectives, or *i*-adjectives. Traditionally, inflected forms of verbal adjectives, such as *takaku* — so-called *ren'yōkei* — from the VA *takai* "to be high/tall", have been analysed as consisting of the so-called stem *taka-* and the so-called ending *-ku*. However, this analysis appears to have limitations. Considering **the morphological, syntactic and semantic parallelism with verbal stems** — such as *tabe* from the verb *taberu* "to eat" — it can be inferred that ***takaku* as a whole corresponds to the stem of the verbal adjective**. This paper thus analyses *taka-* as one of the two immediate constituents of the VA stem *takaku*, which denotes, as a **VA radical**, the core lexical meaning of the verbal adjective and *-ku* as the other constituent, functioning as the **VA thematic suffix** — namely, **VA stem-forming suffix** — that licences the VA radical as a syntactic constituent within the VA category at the sentential level (from the perspective of Distributed Morphology, this constituent may be regarded as an *overt* instantiation of the categorial head *a*). The paper then examines how verbal adjectives encode the tense value [–PAST], proposing a new interpretation based on historical and morphological perspectives. Rather than the traditional view that *-i*, as in *takai*, expresses the non-past, it is argued that the phonologically zero inflexional suffix *-0*, as in [[[[*taka*]*i*]]*0*], acquires the [–PAST] value through opposition to *-ta*, which is specified as [+PAST], as in [[[[*taka*]*k*]*at*]*ta*]. By contrast, the atemporal form *takaku* lacks any temporal suffix as in [[[[*taka*]*ku*]]]. Based on this, the paper further explores the allomorphy of the VA thematic suffix *-i* $\approx$ *-(k)i* $\approx$ *-ku* $\approx$ *-ke* and investigates how the distribution of these allomorphs is determined by their syntactic environments. Finally, the paper explores the similarities between the morphological structures of verbal adjectives and true verbs — particularly vowel-stem verbs.

1. Introduction

The inflected forms of Japanese verbal adjectives — simply adjectives, or *i*-adjectives — are not so transparent in their morphological structure as those of verbs. In verbs, the boundary between the stem and the ending can be clearly determined. Taking the verb *taberu* "to eat" as an example, the non-past form ***taberu*** consists of the stem *tabe-* and the inflexional ending composed of the temporal suffix *-ru*, specified as [–PAST], while the past form ***tabeta*** consists of the same stem *tabe-* and the inflexional ending composed of the temporal suffix *-ta*, specified as [+PAST]. In other words, the opposition between the two forms is reduced to a morphologically transparent opposition between the suffixes *-ru* and *-ta*, both sharing the same stem *tabe-* as their inflexional base.

With verbal adjectives, on the other hand, taking *takai* "to be high/tall" as an example, the non-past form is ***takai***, while the past form is ***takakatta***. Their relationship is not as straightforward as the opposition between the non-past and past forms of verbs such as *taberu* and *tabeta*, and the boundary between the stem and the ending is difficult to determine. Tsujimura (2007: 119) states that "adjectives are identified by a variety of conjugational endings, such as the non-past ending *-i* ... and the past tense ending *-kat-ta*." Following this, in her analysis of the VA *takai*, she treats the non-past form *takai* as consisting of the stem *taka-* + the ending *-i*, and the past form *takakatta* as the stem *taka-* + the ending *-kat-ta*. This appears to represent the traditional and standard analysis in Japanese linguistics.

This paper, in contrast, proposes a different type of analysis, assuming that while the formation of the basic stem of verbal adjectives — the VA stem — takes place at the level of the lexicon, the combination of that basic stem and the inflexional ending occurs at the level of syntax, because such endings are assumed to constitute the phrasal head within the sentence structure. Based on this assumption, the morphological structure of verbal adjectives is analysed as in (1), where "-" (suffixation), "()" (deletion) and "+" (compounding), attached immediately to morphemes, indicate the respective processes:

(1)

Stem: sentential		Ending	
VA stem: lexical		Light verb stem	Inflexional suffix(es)
VA radical	VA thematic suffix		
<i>taka-</i>	<i>-i</i>	—	<i>-0</i> [–PAST]
<i>taka-</i>	<i>-ku</i>	—	— [0 PAST]
<i>taka-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-ta</i> [+PAST]
<i>taka-</i>	<i>-ke</i>	—	<i>-reba</i> "if (cond.)"

As mentioned above, the conclusive form *takai* — the so-called *syūsikei* in Japanese — is traditionally analysed as the stem *taka-* + the ending *-i*, but here, *takai* as a whole is treated as the lexical-level stem — that is, the VA stem. The root *taka-* is then regarded as the VA radical, which

denotes the core lexical meaning of the VA, while *-i* is analysed as the VA thematic suffix — namely, the VA stem-forming suffix. To this VA stem *takai*, the phonologically zero inflexional ending *-0*, specified as [–PAST], is attached as in *takai-0*.

Similarly, the conjunctive/adverbial form *takaku* — the so-called *ren'yōkei* — is generally analysed as the stem *taka-* + the ending *-ku*. Here, however, *takaku* as a whole is likewise treated as the VA stem, with *taka-* regarded as the VA radical and *-ku* as an allomorph of the VA thematic suffix. On the other hand, unlike the above *takai-0*, with the ending *-0* specified as [–PAST], *takaku* lacks any inflexional ending and is thus analysed as consisting solely of the stem, given its atemporality, much like the conjunctive form *tabe* from the verb *taberu*.

In the past form *takak+at-ta* — which is generally analysed as the stem *taka-* + the complex ending *-kat-ta* — *takak*, derived from *takaku* by final-vowel deletion, is considered the lexical-level VP stem. When the VA stem *takaku* combines with the phrasal-head tense suffix *-ta* specified as [+PAST] at the sentential level, the stem *ar-* from the light verb *ar-u* "to be" is inserted immediately after it, as in *takaku#ar-ta*, owing to the incompatibility of *takaku* with the verbal suffix *-ta*. This yields the final form *takak+at-ta*, with the deletion of the stem-final *-u* in *takaku* before *ar-* — which indicates the compounding of *takaku* with *ar-* — and the assimilation *ar-/ar-/* → *at-* [at-].

Finally, the conditional form *takake-reba* — the so-called *kateikei* — is generally analysed as the stem *taka-* + the ending *-kereba*. Here, however, *takake* as a whole is treated as the VA stem, with *taka-* regarded as the VA radical and *-ke* as another allomorph the VA thematic suffix, while *-reba* is exactly the same inflexional suffix found in the verbal conditional form *tabe-reba* from *taberu*. The following will examine the justification for this analysis presented in (1).

2. The identification of the stem of verbal adjectives

Traditionally, as has been repeated, the conclusive form of verbal adjectives has been analysed as consisting of a stem followed by the inflexional ending *-i* — e.g. *takai* consisting of *taka-* + *-i*. On the other hand, the conclusive form of verbs — particularly vowel-stem verbs — has been analysed as consisting of a stem followed by the inflexional ending *-ru*. In *taberu*, for instance, *tabe-* is considered the stem and *-ru* the ending. **Nevertheless, although *taka-* and *tabe-* have been both equally treated as stems, their syntactic behaviour differs significantly.** The verbal stem *tabe-* without overt ending can appear on its own within a sentence as in (2), whereas the so-called adjectival stem *taka-* can never occur independently in such contexts as shown in (3):

(2) *Kare wa gohan o tabe, (sosite) deteitta / deteiku.* "He, having a meal, (then) left / leaves."¹

¹ The translations of the examples in this paper are given in a *literal* manner and may therefore sound (sometimes very) unnatural in English.

(3) **Kanozyo wa se ga **taka**, (sosite) utukusikatta / utukusii.* (ungrammatical)

"She, being tall, was / is (also) beautiful."

What can occur in the same syntactic context as the verbal stem *tabe-* is not the so-called adjectival stem *taka-* itself, but rather the conjunctive/adverbial form *takaku*, as in (4), which has traditionally been analysed — like *takai* — as consisting of the so-called stem *taka-* and the so-called inflexional ending *-ku*:

(4) *Kanozyo wa se ga **takaku**, (sosite) utukusikatta / utukusii.* (grammatical)

"She, being tall, was / is (also) beautiful."

Accordingly, the verbal *tabe-* and the adjectival *takaku-* share the same syntactic property of being **able to occur at the end of non sentence-final coordinated clauses**. Moreover, as is clear from (2) and (4), at the stage of *Kare wa gohan o **tabe*** and *Kanozyo wa se ga **takaku*** in each syntactic string, **it remains indeterminate whether the utterance refers to a past or non-past situation**. Temporal specification is only achieved by the sentence-final predicate — *deteitta / utukusikatta* in the past and *deteiku / utukusii* in the non-past. In this respect as well, the verbal stem *tabe-* and the complex form *takaku-* share the same semantic property of being **atemporal**: they do not themselves make any temporal reference. Furthermore, the similarity between the verbal stem *tabe-* and the complex *takaku-* is not limited to these points; as shown in (5) - (10), both **can appear in the sentence followed by the inflexional suffixes *-te*, *-temo* and *-tatte***.

(5) *Kare wa gohan o **tabe-te**, deteitta / deteiku.* "He, having a meal, then left / leaves."

(6) *Kanozyo wa se ga **takaku-te**, utukusikatta / utukusii.* "She, being tall, was / is beautiful."

(7) *Kare wa gohan o **tabe-temo**, hutoranai.* "He, even having a meal, does not gain weight."

(8) *Kanozyo wa se ga **takaku-temo**, medatanai.* "She, even being tall, does not stand out."

(9) *Kare wa gohan o **tabe-tatte**, hutoranai.* "He, even if he eats, does not gain weight."

(10) *Kanozyo wa se ga **takaku-tatte**, medatanai.* "She, even if tall, does not stand out."

In contrast, the forms **taka-te*, **taka-temo* and **taka-tatte* — each composed of **the so-called stem *taka-* followed by an inflexional suffix *-te*, *-temo* and *-tatte*** — are all ungrammatical. In this way, there is **clear syntactic, semantic and morphosyntactic parallelism between *tabe-* and *takaku-***. Given that *tabe-* is analysed as the stem of the verb, it seems more appropriate to treat *takaku-* — not as the combination of the so-called stem *taka-* and the so-called inflexional ending *-ku*, as traditionally assumed — but rather **as the stem of the verbal adjective in its entirety**, which we shall henceforth refer to as **the VA stem**.

Historically, there was an etymological form in Old Japanese from which the modern verbal form *tabe-tatte* originated — namely, *tabe-tari-tote*, which later changed to *tabe-ta-tote*. In contrast, the modern VA form *takaku-tatte* does not have a comparable direct etymon in Old Japanese, such as **takaku-tari-tote*, nor in later Japanese, such as **takaku-ta-tote*, both of which would have been agrammatical. What this suggests is that the modern *takaku-tatte* seems to have been formed by inserting the VA stem *takaku-* into the verbal stem position within the already existing word structure composed of "the verbal stem + the inflexional suffix *-tatte*" — as in *tabe-tatte* — on the basis of their morphosyntactic commonality as stems. In other words, the very existence of such an inflected form as *takaku-tatte* can be taken as evidence that the VA stem, which has the same status as verbal stems such as *tabe-* as predicative stems, is not *taka-* but *takaku-*. All of the above discussion leads to the following question: how, then, should *taka-* — traditionally regarded as the stem — and *-ku* — traditionally regarded as the inflexional ending — be reanalysed morphologically as inflexional constituents? This issue will be discussed in the following section.

3. The radical and the thematic suffix of verbal adjectives

When we observe the inflected forms of the verbal adjective *takai* — namely, *takai* $\approx$ *taka(k)i* $\approx$ *takaku* $\approx$ *takakute* $\approx$ *takakutemo* $\approx$ *takakutatte* $\approx$ *takakatta* $\approx$ *takakattarō* $\approx$ *takakattara(ba)* $\approx$ *takakattari* $\approx$ *takakarō* $\approx$ *takakare* $\approx$ *takakereba* — we find that they all share the element *taka-*. This *taka-* is also attested in derived nouns such as *takasa* "height" and *takami* "loftiness" as well as in compound nouns such as *takanozomi* "high hope" and *takadai* "high platform", where it refers to the very property or state of "being high/tall". Since it cannot be further decomposed into smaller morphemes, it is to be regarded as a root. However, as the ungrammaticality of (11) clearly shows, the root *taka-* alone cannot function as a verbal adjective — that is, it cannot be inserted into a terminal node dominated by the VA node — and thus cannot establish structural relations with other constituents within the sentence:

(11) **Koko kara, taka sobieru tō ga mieru.* (ungrammatical)

"From here, a tower rising high can be seen."

By contrast, example (12), in which *taka-* is accompanied by *-ku*, is grammatical:

(12) *Koko kara, takaku sobieru tō ga mieru.* (grammatical)

"From here, a tower rising high can be seen."

Now, as the derived words and compound words cited above show, **the root *taka-* functions only as a mere constituent of word formation:** it cannot itself serve as a syntactic unit at the sentence

level. We are thus led to posit that *taka-* requires an additional element in order to function as a syntactic category VA at the sentence level. This element is precisely *-ku*, which is present in the sentential form *takaku*, but absent from word-level forms such as *takasa*, *takami*, *takanozomi* and *takadai*. As observed in Section 2, the addition of *-ku* to the root *taka-* yields a verbal adjective stem that is functionally — more precisely, syntactically, semantically and morphosyntactically — equivalent to the verbal stem *tabe-*. We shall therefore refer to *-ku* as the **VA thematic suffix** — namely, the **VA stem-forming suffix**. From the perspective of Distributed Morphology, this constituent may be regarded as an *overt* instantiation of the categorial head *a*, a category-defining element that is otherwise often assumed to be *covert*.

The historical development of verbal adjectives also supports this interpretation: "Originally, adjectives, remaining as stems, were positioned before nouns and verbs, modifying them, as in *nagauta*, *takayuku*. However, to explicitly express the functions of the conjunctive, attributive and conclusive forms, inflected forms such as *takaku*, *takaki*, *takasi* were established. Moreover, after the Nara period, forms such as *takakere* developed as realis forms *izenkei*. In this way, adjectives performing the role of predicates developed more slowly" (Ōno, S., et al. (Eds.). 1990: 1467, translated from Japanese). From the perspective of this paper, **the VA radical** — e.g. *naga-* "long" and *taka-* "high/tall" — **originally functioned only as a formative element at the lexicon level, forming compounds** such as *naga+uta* "long poem" and *taka+yuku* "to fly high into the sky", **placed before base nouns or base verbs. However, in order to function as the head of a VA phrase at the sentential level, that is, to function as a category VA, the thematic suffix *-ku* $\approx$ *-ki* $\approx$ *-si* $\approx$ *-ke*, as in *taka-ku* $\approx$ *taka-ki* $\approx$ *taka-si* $\approx$ *taka-ke* — corresponding to *-ku* $\approx$ *-(k)i* $\approx$ *-i* $\approx$ *-ke* in Contemporary Japanese, as in *taka-ku* $\approx$ *taka-(k)i* $\approx$ *taka-i* $\approx$ *taka-ke* — was added.** The origin of these conjunctive/adverbial form, attributive form, conclusive form and realis form ending in the VA thematic suffix *-ku* $\approx$ *-ki* $\approx$ *-si* $\approx$ *-ke* — namely, *ren'yōkei*, *rentaikei*, *shūshiikei* and *izenkei* — is explained in Okimori (2017: 85–88).

Let us now turn to the morphological status of the constituent *taka-* within the VA stem. In the preceding discussion, *taka-* was referred to as a root in relation to *-ku*, but this designation is not strictly accurate from the viewpoint of morphological structure. As *na+daka-* — derived from *na* "name" + *taka-* "high", with *rendaku* in the second element — in the compound verbal adjective *na+daka-i* "to be famous" in (13) shows, what precedes the VA thematic suffix need not be a single root, but may also involve root-root compounding:

(13) *Yamazaki wa na+daka-i gengogakusya da.* "Yamazaki is a famous linguist."

It is therefore morphologically inappropriate to refer to the constituent preceding the VA thematic suffix *-ku* $\approx$ *-i* as a root. In what follows, we shall refer to it as a **VA radical**, in the sense of **one**

of the two immediate constituents of a VA stem that constitutes its semantic core.

As the inflected forms *takaku*, *takaku-te*, *takaku-temo* and *takaku-tatte* show, the VA stem formed with the suffix *-ku* — namely, *takaku-* — can appear on its own, or followed by the suffixes *-te*, *-temo* and *-tatte*. From this, the structure of verbal adjectives may be analysed as in (14):

(14)

VA stem		Ending
VA radical	VA thematic suffix	Inflexional suffix
<i>taka-</i>	<i>-ku</i>	—
<i>taka-</i>	<i>-ku</i>	<i>-te</i>
<i>taka-</i>	<i>-ku</i>	<i>-temo</i>
<i>taka-</i>	<i>-ku</i>	<i>-tatte</i>

It can be confirmed that the morphemes *-te*, *-temo* and *-tatte* are inflexional suffixes as follows. In *takaku-te*, *takaku-temo* and *takaku-tatte*, it is possible to insert syntactically the focus particle *mo* "too, also" or the topicalisation/contrast particle *wa* "as for, etc." — both of which are enclitics — immediately after the verbal adjective stem *takaku-*. In these cases, the stem allomorph *at-* from the light verb *ar-u* "to be" is consistently inserted before *-te*, *-temo* and *-tatte*, as shown in (15), where # denotes a morphological word boundary that coincides with a prosodic word boundary and = indicates enclisis:

- (15) *takaku-te* → *takaku=mo#at-te* vs. **takaku=mo#te* "being also high/tall"
takaku-temo → *takaku=wa#at-temo* vs. **takaku=wa#temo* "high/tall, though it is so"
takaku-tatte → *takaku=wa#at-tatte* vs. **takaku=wa#tatte* "high/tall, even if it is so"

In the case of the verbal forms *tabe-te*, *tabe-temo* and *tabe-tatte* in (5), (7), (9), the situation is exactly the same, as indicated in (16):

- (16) *tabe-te* → *tabe=mo#si-te* vs. **tabe=mo#te* "doing also eat"
tabe-temo → *tabe=wa#si-temo* vs. **tabe=wa#temo* "though it does eat"
tabe-tatte → *tabe=wa#si-tatte* vs. **tabe=wa#tatte* "even if it does eat"

In this case, a stem allomorph *si-* from the light verb *su-ru* "to do" is inserted before *-te*, *-temo* and *-tatte*. From (15) and (16), the following observations (17)–(20) may be drawn:

- (17) In *takaku-te*, *takaku-temo* and *takaku-tatte* in (15) and *tabe-te*, *tabe-temo* and *tabe-tatte* in (16), respectively, it is possible to insert the enclitic particles *mo* or *wa* immediately after the VA stem *takaku-* and the V stem *tabe-* at the syntactic level. This indicates that *takaku-* and

tabe- can occupy the same structural position in syntax and, here too, **syntactic parallelism is observed between *takaku-* and *tabe-***.

(18) In both (15) and (16), if *-te*, *-temo* and *-tatte* were free morphemes and could constitute autonomous words, then forms such as **takaku=mo#te*, etc. and **tabe=mo#te*, etc. should be grammatical as they are. This is not the case, however: only when the stems of the light verbs *at-* and *si-* are inserted, do the forms become grammatically adequate. It follows, then, that *-te*, *-temo* and *-tatte* are inflexional suffixes which cannot constitute a word independently and, formally, always require a stem.

(19) Based on (18), the insertion of the light verb stems *at-* and *si-* in *takaku-te* → *takaku=mo#at-te*, etc. in (15) and *tabe-te* → *tabe=mo#si-te*, etc. in (16) indicates that, since both *takaku-* and *tabe-* function as stems for the inflexional suffixes *-te*, *-temo* and *-tatte* in *takaku-te*, etc. and *tabe-te*, etc., the insertion of the enclitic particles *mo* or *wa* between the stems and the suffixes renders the latter stemless, and therefore requires the subsequent insertion of alternative formal stems — namely, *at-* and *si-* — before them, because *mo* and *wa* cannot function as stems for them. This again supports the claim that **it is not *taka-* but *takaku-* in its entirety that functions as the stem in VAs** and, here too, **morphological parallelism is observed between *takaku-* and *tabe-***.

(20) In (15), the reason why it is not some VA stem but the verbal stem *at-* that is inserted in *takaku=mo#at-te*, etc. is simply that Japanese lacks a class of light verbal adjectives and their corresponding stems, and hence some verbal stem must be instead employed to support formally the suffixes *-te*, *-temo* and *-tatte* even in *takaku=mo#at-te*, *takaku=wa#at-temo* and *takaku=wa#at-tatte*. But why is it not the stem *si-* from *su-ru* but the stem *at-* from *ar-u* that is selected? The motivation seems to be that the prototypical categorical distinction — *stativity* vs. *dynamicity* — between the verbal adjective stem *takaku-* and the verb stem *tabe-* conditions the selection of stems between the *stative* light verb *ar-u* "to be" and the *dynamic* light verb *su-ru* "to do". The syntactic process that determines this selection based on semantics remains a topic for future investigation.

Together with the description at the end of Section 2, it can be observed that **between the verbal adjective stem *takaku-* and the verbal stem *tabe-*, clear and multiple parallelism — morphological, syntactic, morphosyntactic and semantic — is evident**.

Next, let us turn to more complex structures: in the inflected forms *taka-k+at-ta*, *taka-k+at-tar-ō*, *taka-k+at-tar-a(ba)*, *taka-k+at-tar-i*, *taka-k+ar-ō*, *taka-k+ar-e*, if the focus particle *mo* "too,

also" is inserted before the conjugated forms of the light verb *ar-u* "to be" — namely, *at-ta*, *at-tar-ō*, *at-tar-a(ba)*, *at-tar-i*, *ar-ō* and *ar-e* — and the string is thereby divided into two words, the following alternations in (21) can be observed:

(21) <i>taka-k+at-ta</i> $\approx$ <i>taka-ku=mo#at-ta</i>	"It was high/tall" $\approx$ "... also high/tall"
<i>taka-k+at-tar-ō</i> $\approx$ <i>taka-ku=mo#at-tar-ō</i>	"It would be high/tall" $\approx$ "... also high/tall"
<i>taka-k+at-tar-a(ba)</i> $\approx$ <i>taka-ku=mo#at-tar-a(ba)</i>	"If it is/were high/tall" $\approx$ "... also high/tall"
<i>taka-k+at-tar-i</i> $\approx$ <i>taka-ku=mo#at-tar-i</i>	"Sometimes it is high/tall" $\approx$ "... also high/tall"
<i>taka-k+ar-ō</i> $\approx$ <i>taka-ku=mo#ar-ō</i>	"It will be high/tall" $\approx$ "... also high/tall"
<i>taka-k+ar-e</i> $\approx$ <i>taka-ku=mo#ar-e</i>	"Be high/tall" $\approx$ "... also high/tall"

From this, it can be seen that the VA thematic suffix *-ku* undergoes vowel deletion and surfaces as *-k* when it precedes the vowel-initial stem of the light verb *ar-u*, namely *ar- $\approx$ at-*. This vowel deletion can be taken to indicate that the VA stem and the light verb stem — each of which can function as an autonomous word — have come to form a single compound stem.

The reason why the inflected forms in (21) contain *ar-* or *at-* — the stem allomorphs of the light verb *ar-u* — is that the endings *-ta*, *-tar-ō*, *-tar-a(ba)*, *-tar-i*, *-ō*, *-e*, which express tense or/and modality, combine only with purely verbal stems. In other words, *takaku* is a non-verbal stem and thus cannot combine directly with these endings. Consequently, the VA stem *taka-ku* combines with the stem *ar-* of the light verb *ar-u*, forming a compound verbal stem *taka-k+ar-* ($\leftarrow$ *taka-ku* + *ar-*) at the sentence level, which as a whole comes to possess verbal status. This is made possible by the fact that Japanese is a head-final language, whereby the light verb stem *ar-* determines the syntactic category of the entire compound *taka-k+ar-*. Under this interpretation, the structure of (14) may be more accurately represented as in (22), where "-", "()" and "+" indicate suffixation, deletion and compounding, respectively, as in (1):

Stem: sentential			Ending
VA stem: lexical		Light verb stem	Inflexional suffix(es)
VA radical	VA thematic suffix		
<i>taka-</i>	<i>-ku</i>	—	—
<i>taka-</i>	<i>-ku</i>	—	<i>-te</i>
<i>taka-</i>	<i>-ku</i>	—	<i>-temo</i>
<i>taka-</i>	<i>-ku</i>	—	<i>-tatte</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-ta</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-tar-ō</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-tar-a(ba)</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-tar-i</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+ar-</i>	<i>-ō</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+ar-</i>	<i>-e</i>

Besides the both morphologically and phonologically conditioned allomorphy $-ku \approx -k$, the VA thematic suffix exhibits another type of allomorphy $-ku \approx -i \approx -(k)i \approx -ke$ depending on the syntactic environment in which it occurs, as shown in (23)-(28):

(23) **Kanozyo wa se ga taka.*

(24) *Kanozyo wa se ga takai.* "She is tall."

(25) **Asoko ni se no taka otoko ga iru.*

(26) *Asoko ni se no takai otoko ga iru.* (Classical: *takaki*) "There is a tall man over there."

(27) **Se ga taka-reba ii to yū wake de wa nai.*

(28) *Se ga takake-reba ii to yū wake de wa nai.* "It is not always the case that it is good if the height is tall."

Among these, *taka-ke* in (28), which bears the allomorph *-ke*, occurs in modern Japanese exclusively before the suffix *-reba*, which denotes a sequential conditional: hence, *taka-ke-reba* is referred to as the conditional form. By contrast, the syntactic conditions that determine the occurrence of *taka-i* in (24) and *taka-(k)i* in (26), bearing the allomorphs *-i* and *-(k)i* respectively, will be examined in the following section.

4. Syntactic conditions governing the allomorphy: $-i \approx -(k)i \approx -ku \approx -ke$

As observed in (4), the conjunctive/adverbial form *taka-ku*, in which the VA thematic suffix appears in the form *-ku* and no inflexional ending follows, is atemporal. The fact that the form *taka-ku* lacks temporal reference is consistent with the interpretation that it does not bear any inflexional suffix expressing tense or modality. By contrast, the conclusive form *taka-i* and the attributive form *taka-(k)i* — so-called *rentaikei* — appear to lack any inflexional ending just like the conjunctive/adverbial form *taka-ku*, yet unlike *taka-ku*, they bear non-past value. The question, then, is how this non-past value is formally encoded. Traditionally, the final *-i* in *taka-i* and *taka-(k)i* has often been interpreted as the word constituent that bears the temporal value of non-past. This interpretation is difficult to justify, however, both from a historical perspective and from the classical yet fundamental Saussurean thesis that **linguistic value arises from opposition**. For the *-i* in *taka-i* to acquire the [–past] value, it must be paradigmatically opposed to the past suffix *-ta*. This would require the existence of a form **taka-ta*, in the same way that the suffix *-ru* in *tabe-ru* acquires the [–past] value only by being opposed to the suffix *-ta* in *tabe-ta*, but in fact no such form as **taka-ta* exists. Conversely, for the *-ta* in the attested form *takakat-ta* to acquire the [+past] value in opposition to *-i*, the hypothetical form **takakat-i* would be required. To what, then, is the *-i* in *taka-i* actually opposed in order to acquire the [–past] value?

Historically, verbal adjectives originally lacked a non-past vs. past tense opposition and,

accordingly, they contained no formal element that encoded tense. For example, in Old Japanese of the 8th century, forms such as *taka-si*, *taka-ki* and *taka-ku* consisted, from the standpoint of the present analysis, solely of the stem, lacking any inflexional ending. However, probably due to the increasing need to encode the *past* value more explicitly, the past tense suffix *-ki* — which was solely compatible with verbal stems — and the stem allomorph *ari-* with epenthetic *-i* of the light verb *ari* "to be" were employed to constitute the past tense form *taka-k+ari-ki*. As Okimori (2017: 84) states, "The secondary conjugation known as *kari*-conjugation was formed by the conjunctive/ adverbial form being followed by the *rahen* verb *ari*, through the development *ku-ari* > *kari*. This made it possible for the form to attach to a wide range of particles and auxiliary verbs" (translated from Japanese).

This suggests that the conclusive form *taka-si* and the attributive form *taka-ki*, which originally lacked any overt tense marker, came to bear *non-past* value through their formal opposition to the newly constructed past form *taka-k+ari-ki* — that is, by lacking the overt tense suffix *-ki*. In other words, from the perspective of formal opposition, these two forms came to be analysed as bearing a zero inflexional suffix *-0* specified as [–PAST] as in *taka-si-0* and *taka-ki-0*, which came to stand in opposition to the past-tense inflexional suffix *-ki* specified as [+PAST] as in *taka-k+ari-ki*. This is parallel to the case of English *cat-0*, where the lack of an overt plural marker in opposition to *cat-s* functions to denote the singular. Based on the above, the morphological structure of the classical forms *taka-si*, *taka-ki*, *taka-ku* and *taka-k+ari-ki* may be analysed as in (29):

(29)

Stem: sentential			Ending
VA stem: lexical		Light verb stem	Inflexional suffix
VA radical	VA thematic suffix		
<i>taka-</i>	<i>-si</i>	—	<i>-0</i> [–PAST]
<i>taka-</i>	<i>-ki</i>	—	<i>-0</i> [–PAST]
<i>taka-</i>	<i>-ku</i>	—	— [0PAST]
<i>taka-</i>	<i>-k(u)</i>	<i>+ari-</i>	<i>-ki</i> [+PAST]

In the case of modern Japanese as well, it may be assumed that the partial system in (29) remains unchanged, with the past tense suffix *-ki* simply having been replaced by *-ta*, as shown in (30):

(30)

Stem: sentential			Ending
VA stem: lexical		Light verb stem	Inflexional suffix
VA radical	VA thematic suffix		
<i>taka-</i>	<i>-i</i>	—	<i>-0</i> [–PAST]
<i>taka-</i>	<i>-(k)i</i>	—	<i>-0</i> [–PAST]
<i>taka-</i>	<i>-ku</i>	—	— [0PAST]
<i>taka-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-ta</i> [+PAST]

What remains to be discussed are the relationship between the conclusive form *taka-i* and the

attributive form *taka-(k)i*, and the conditions that determine their distribution in relation to the conditional form *taka-ke* and the conjunctive/adverbial form *taka-ku*. The first two forms, *taka-i* and *taka-(k)i*, share the VA radical *taka-* and a zero tense suffix *-0* specified as $[-\text{PAST}]$, but differ in the shape of the VA thematic suffix: *-i* in the conclusive form and *-(k)i* in the attributive form. Correspondingly, they occur in distinct syntactic environments:

(31) *Utukusi-(k)i hito* "A beautiful person":

$[\text{NP} [\text{CP} [\text{TP} [\text{VAP} \text{op}_i \text{utukusi-}(\mathbf{k})\mathbf{i}] -0] -0] \text{hito}_i] \rightarrow [\text{NP} [\text{CP} [\text{TP} [\text{VAP} \text{op}_i t_a] \text{utukusi-}(\mathbf{k})\mathbf{i}_a-0] -0] \text{hito}_i]^2$

(32) *Kanozyo ga³ utukusi-i* "She is beautiful":

$[\text{TP} [\text{AP} \text{kanozyo utukusi-}\mathbf{i}] -0] \rightarrow [\text{TP} \text{kanozyo}_i\text{-ga} [\text{AP} t_i t_a] \text{utukusi-}\mathbf{i}_a-0]$

As shown in (31), when an VAP functions as the complement of TP headed by T *-0* $[-\text{PAST}]$ and this TP is embedded within an NP, the VA thematic suffix appears in the form *-(k)i*. By contrast, when an VAP functions as the complement of TP headed likewise by T *-0* $[-\text{PAST}]$ but the TP is not embedded within an NP, as in (32), the VA thematic suffix appears in the form *-i*. As for the remaining forms *-ke* and *-ku*, *-ke* in modern Japanese is exclusively distributed in the environment preceding the TP-head suffix *-reba* as in (33):

(33) *Kanozyo ga utukusi-ke-reba* "If she is beautiful":

$[\text{TP} [\text{AP} \text{kanozyo utukusi-}\mathbf{ke}] -\text{reba}] \rightarrow [\text{TP} \text{kanozyo}_i\text{-ga} [\text{AP} t_i t_a] \text{utukusi-}\mathbf{ke}_a\text{-reba}]$

while *-ku* is the form taken by the VA thematic suffix in all other syntactic environments.

5. Structural similarities with verbal inflected forms

The following examines the inflected forms of the vowel-stem verb *nobiru* "to stretch/extend" (intransitive) and its classical form *nobu*, and demonstrates the significant structural parallels between these forms and the inflected forms of the verbal adjective *takai* "to be high/tall" and its classical form *takasi*.

The one-argument verb *nobiru* is a non-accusative one, with the stem *nobi-*. On the other hand, the morphologically and semantically corresponding two-argument and accusative verb *noberu*

² There is also the possibility of $[\text{NP} [\text{CP} [\text{TP} [\text{VAP} \text{op}_i \text{utukusi-}(\mathbf{k})\mathbf{i}] -0] -0] \text{hito}_i] \rightarrow [\text{NP} [\text{CP} \text{op}_i [\text{TP} [\text{VAP} t_i t_a] \text{utukusi-}(\mathbf{k})\mathbf{i}_a-0] -0] \text{hito}_i]$. However, this paper employs a simplified model focusing on the allomorphy of the VA thematic suffix $-i \approx -(k)i \approx -ku \approx -ke$ and on its syntactic conditions, leaving full syntactic verification to future work.

³ *Kanozyo wa utsukusi-i* is a much more natural expression, with the subject *Kanozyo* topicalised through *-wa*: $[\text{TopicP} \text{kanozyo}_i\text{-wa} [\text{TP} t_i [\text{AP} t_a] \text{utsukusi-}\mathbf{i}_a-0] -0]$.

"to stretch/extend" (transitive) has the stem *nobe-*. The shared element *nob-* in both the non-accusative verb stem *nobi-* and the accusative verb stem *nobe-* is present in all the inflected forms of these two verbs. Moreover, since the meaning of "stretching/extension" as a state change is common to all their inflected forms, it can be concluded that *nob-* represents the state change of "stretching/extension". In modern Japanese, although the accusative verb corresponding to *nobiru* is more commonly *nobasu*, the stem *nobas-* of this verb also contains *nob-*, which represents the same state change.

Thus, the stem *nobi-* contains a morpheme boundary within it, as in *nob-i-*. Since neither *nob-* nor *-i* can be further segmented into smaller sequential units, *nob-* is the immediate constituent of the verbal stem *nob-i-* and, denoting the core lexical meaning of the verb, can be considered, alongside the VA radical discussed in Section 3, the radical of the verb — the **V radical**. On the other hand, the *-i* in *nob-i-* combines with the V radical *nob-* to form the stem of the verb — the **V stem** — and it is assumed to function to licence the V radical as a category V at the sentential level. Thus, in parallel with the VA thematic suffix discussed in Section 3, *-i* can be considered the thematic suffix of the verb — the **V thematic suffix**. This suffix *-i* is also assumed to confer non-accusativity and a one-argument structure as its valency to the V radical *nob-* through its opposition to *-e* in the accusative verb stem *nob-e-*, which, like *-i*, is a V thematic suffix.

Based on the above analysis, the morphological structure of the following inflected forms of VA *takai* — *taka-i-0*, *taka-(k)i-0*, *taka-ku*, *taka-ke-reba*, *taka-k+at-ta* — and their corresponding forms of V *nobiru* — *nob-i-ru*, *nob-i-ru*, *nob-i*, *nob-i-reba*, *nob-i-ta* — is as shown in (34):

(34)

Stem: sentential			Ending
Stem: lexical		Light verb stem	Inflexional suffix
Radical	Thematic suffix		
<i>taka-</i>	<i>-i</i>	—	<i>-0</i> [–PAST]
<i>nob-</i>	<i>-i</i>	—	<i>-ru</i> [–PAST]
<i>taka-</i>	<i>-(k)i</i>	—	<i>-0</i> [–PAST]
<i>nob-</i>	<i>-i</i>	—	<i>-ru</i> [–PAST]
<i>taka-</i>	<i>-ku</i>	—	— [0 PAST]
<i>nob-</i>	<i>-i</i>	—	— [0 PAST]
<i>taka-</i>	<i>-ke</i>	—	<i>-reba</i>
<i>nob-</i>	<i>-i</i>	—	<i>-reba</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-ta</i> [+PAST]
<i>nob-</i>	<i>-i</i>	—	<i>-ta</i> [+PAST]

Except that the tense [–PAST] is encoded by *-0* in VA *taka-i-0* and by *-ru* in V *nob-i-ru*, and that, in VA, the stem *at-* of the light verb *ar-u* may be inserted at the sentence level, the basic structure is the same. The inflected forms of the corresponding classical forms *takasi* and *nobu* exhibit even greater structural similarity, as indicated in (35):

(35)

Stem: sentential			Ending
Stem: lexical		Light verb stem	Inflexional suffix
Radical	Thematic suffix		
<i>taka-</i>	<i>-si</i>	—	<i>-0</i> [–PAST]
<i>nob-</i>	<i>-u</i>	—	<i>-0</i> [–PAST]
<i>taka-</i>	<i>-ki</i>	—	<i>-0</i> [–PAST]
<i>nob-</i>	<i>-u</i>	—	<i>-ru</i> [–PAST]
<i>taka-</i>	<i>-ku</i>	—	— [0PAST]
<i>nob-</i>	<i>-i</i>	—	— [0PAST]
<i>taka-</i>	<i>-ke</i>	—	<i>-reba</i>
<i>nob-</i>	<i>-u</i>	—	<i>-reba</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+ari-</i>	<i>-ki</i> [+PAST]
<i>nob-</i>	<i>-i</i>	—	<i>-ki</i> [+PAST]

As the VA thematic suffix shows allomorphy $-si \approx -ki \approx -ku \approx -ke$ depending on the syntactic environment, the V thematic suffix also exhibits the alternation $-i \approx -u$ according to the syntactic context in Antient language. Furthermore, the conclusive form *nob-u-0* of the classical *nobu*, corresponding to the modern *nobiru*, like the conclusive form *taka-si-0* of the classical *takasi*, corresponding to the modern *takai*, denoted [–PAST] with *-0*, differently from modern Japanese. The only instance where the parallelism in the suffixes breaks down is in the attributive forms *taka-ki-0* and *nob-u-ru*, but there seems to be a reason for this. In VA *takasi*, the opposition between the conclusive form and the attributive form was maintained by the alternation of the thematic suffix allomorphs $-si \approx -ki$, as in *taka-si-0* and *taka-ki-0*, whereas in V *nobu*, the thematic suffix allomorph was the same in both forms — namely, *-u* — and the opposition was instead maintained by the alternation of the past tense suffix allomorphs $-0 \approx -ru$, as in *nob-u-0* and *nob-u-ru*.

6. Negative forms of verbal adjectives

Both verbs and verbal adjectives form their negative constructions by attaching the negator *nai* to their stems, as in *tabe-nai* "not to eat" from the verb *tabe-ru* and *takaku#nai* "not to be high/tall" from the verbal adjective *takai*. This negator belongs to the verbal adjective category, given its inflexion — namely, $na-i \approx na-ku \approx na-ku-te \approx na-ku-temo \approx na-ku-tatte \approx na-k+at-ta \approx na-k+at-tar-ō \approx na-k+at-tar-a(ba) \approx na-k+at-tar-i \approx na-k+ar-ō \approx na-ke-reba$, as in *tabe-na-i \approx tabe-na-ku \approx tabe-na-ku-te \approx tabe-na-ku-temo \approx tabe-na-ku-tatte \approx tabe-na-k+at-ta \approx tabe-na-k+at-tar-ō \approx tabe-na-k+at-tar-a(ba) \approx tabe-na-k+at-tar-i \approx tabe-na-k+ar-ō \approx tabe-na-ke-reba* and *takaku#na-i \approx takaku#na-ku \approx takaku#na-ku-te \approx takaku#na-ku-temo \approx takaku#na-ku-tatte \approx takaku#na-k+at-ta \approx takaku#na-k+at-tar-ō \approx takaku#na-k+at-tar-a(ba) \approx takaku#na-k+at-tar-i*

$\approx takaku\#na-k+ar-\bar{o} \approx takaku\#na-ke-reba$ — which is completely identical to that of the verbal adjective *takai* — namely, $taka-i \approx taka-ku \approx taka-ku-te \approx taka-ku-temo \approx taka-ku-tatte \approx taka-k+at-ta \approx taka-k+at-tar-\bar{o} \approx taka-k+at-tar-a(ba) \approx taka-k+at-tar-i \approx taka-k+ar-\bar{o} \approx taka-ke-reba$.

Although the above negative forms *tabe-nai* and *takaku#nai* may at first sight appear to exhibit the same morphological structure in that both consist of the stem + the negator *nai*, their structures in fact differ: **the negator -*na-i* in *tabe-nai* functions as a sequence of suffixes, whereas *na-i* in *takaku#nai* constitutes an autonomous word**, as illustrated in (36):

(36) <i>tabe-nai</i>	$\rightarrow tabe=wa\#si-nai$	vs. $*tabe=wa\#nai$	"eat, it does not"
<i>tabe-nai</i>	$\rightarrow tabe=mo\#si-nai$	vs. $*tabe=mo\#nai$	"it does not eat either"
<i>takaku#nai</i>	$\rightarrow takaku=wa\#nai$	vs. $*takaku=wa\#ara-nai$	"high/tall, it is not"
<i>takaku#nai</i>	$\rightarrow takaku=mo\#nai$	vs. $*takaku=mo\#ara-nai$	"it is not high/tall either"
cf. <i>takaku-te</i>	$\rightarrow takaku=mo\#at-te$	vs. $*takaku=mo\#te$	in (15)

Both in *tabe-nai* and in *takaku#nai*, the enclitic particles *mo* and *wa* can be syntactically inserted immediately after the verbal stem *tabe-* and the verbal-adjective stem *takaku-*, just like the examples in (15) and (16) above. In the former case, the stem allomorph *si-* from the light verb *su-ru* must be inserted before the negator *-nai* as in *tabe=wa/mo\#si-nai*. The reason is as follows: since *-nai* function as a sequence of suffixes with respect to the stem *tabe-* in *tabe-nai*, once the particle *mo* or *wa* is inserted between the stem *tabe-* and the suffixes *-nai*, the latter are left stemless. Consequently, an alternative formal stem must be supplied — namely, *si-* from *su-ru* — because *mo* and *wa* cannot function as stems for *-nai*. In the latter case, by contrast, the same particle insertion does not entail the insertion of the stem allomorph *ara-* from the light verb *ar-u* before *nai* as in *takaku=wa/mo\#nai*, which indicates that, in *takaku#nai*, the string *nai* functions as an autonomous word in relation to the other autonomous word *takaku* and therefore requires no stem before it. The negator *nai* in *takaku#nai* is morphologically different, for example, from the suffix *-te* in *takaku-te*, which requires the stem allomorph *at-* from *ar-u* in the particle-inserted form *takaku=mo\#at-te*, as already illustrated in (15).

The question arises, then, why the negator *nai* functions morphologically as a string of suffixes in *tabe-nai* but as an autonomous word in *takaku#nai*. In other words, why is there a lack of parallelism in structure between the negative forms of verbs and those of verbal adjectives? This seems to be related to the fact that, in contemporary Japanese, the negative form of the verb *ar-u* is not $*ara-nai$ — composed of the stem allomorph *ara-* from *ar-u* and the suffixes *-nai*, as in *tabe-nai* from *tabe-ru* and *noma-nai* from *nom-u* "to drink" — but rather simply *nai*, which is not categorially a verb but a verbal adjective, as *takai* is. In other words, **the verbal adjective *nai* is**

a kind of suppletive form corresponding to the hypothetical negative form **ara-nai* within the inflexional paradigm of the verb *ar-u*.

Building on this suppletion, let us hypothesise that, in the negation of verbal adjectives such as *takai*, it is likewise the suffixes *-nai* used for verbs — rather than the autonomous word *nai* — that are employed *underlyingly*, as in the case of verbal negation. The derivation from *takai* + *-nai* to the attested surface form *takaku#nai* is then assumed to proceed as shown in (37):

$$(37) \text{takai} + \text{-nai} \rightarrow *takaku\#ara\text{-nai} \rightarrow takaku\#nai$$

Since the verbal-adjective stem *takaku-* is not compatible with the negative suffix *-na*, which is verbal and subcategorises for purely verbal stems, the stem allomorph *ara-* from the light verb *ar-u* is inserted immediately after *takaku-*, thereby constituting, together with it, a composite verbal stem *takaku#ara-* at the sentence level. This composite stem as a whole acquires verbal status, due to the head-finality of this language, and can combine directly with the verbal suffix *-na*, yielding the hypothetical intermediate string **takaku#ara-nai*, by the addition of the VA thematic suffix *-i* following *-na*. The negative form **ara-nai* in **takaku#ara-nai*, however, surfaces as *nai*, owing to the above obligatory suppletion within the inflexional paradigm of *ar-u*, giving the surface form *takaku#nai*.

In Old Japanese, on the other hand, the negative form of the light verb *ari*, which corresponds to the modern *ar-u*, was not *nasi*, which corresponds to the modern *nai*, but rather *ara-zu* with the negative suffix *-zu*, which corresponds to the modern *-nai* — just as the negative forms of *tabu-0*, corresponding to the modern *tabe-ru*, and *nom-u* were *tabu-zu* and *noma-zu*, respectively. Consequently, in the derivation of the negative form of *takasi*, which corresponds to the modern *takai*, the negative form *ara-zu* was not replaced by *nasi*, as shown in (38):

$$(38) \text{takasi} + \text{-zu} \rightarrow takaku\#ara\text{-zu} \rightarrow takak+\text{ara-zu} \text{ vs. } *takaku\#nasi$$

Analysed in this way, the distinctive difference between Modern and Old Japanese in the formation of the negative forms of verbal adjectives lies in the modern suppletion of the negative form **ara-nai* of the light verb *ar-u* by *nai*, and the derivation schematised in (37) seems entirely plausible. Thus, the verbal-adjective negative form *takaku#nai-0*, with the endig *-0* specified as [–past] — assumed to be derived from **takaku#ara-nai-0* — exhibits *underlyingly* the same structure as the verbal negative form *tabe-nai-0*, in that both strings are composed of **stem-negator-ending**, apart from the difference in the degree of complexity between the stems **takaku#ara-* and *tabe-*.

Based on the above discussion, the surface negative forms of the VA *takai* can be analysed as in

(39), where R, TS and S represent the radical, the thematic suffix and the stem, respectively:

(39)

Word		Word			
VA S: sentential		Negator S: sentential			Ending
VA S: lexical		Negator S: lexical		Light verb stem	Inflexional suffix(es)
VA R	VA TS	Negator R	Negator TS		
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-i</i>	—	<i>-0</i> [–PAST]
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-(k)i</i>	—	<i>-0</i> [–PAST]
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-ke</i>	—	<i>-reba</i>
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-ku</i>	—	— [0 PAST]
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-ku</i>	—	<i>-te</i> [0 PAST]
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-ku</i>	—	<i>-temo</i>
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-ku</i>	—	<i>-tatte</i>
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-ta</i> [+PAST]
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-tar-ō</i>
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-tar-a(ba)</i>
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-tar-i</i>
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-k(u)</i>	<i>+ar-</i>	<i>-ō</i>
<i>taka-</i>	<i>-ku</i>	<i>na-</i>	<i>-k(u)</i>	<i>+ar-</i>	<i>-e</i>

7. Analysis summary — Conclusion

(i) The morphological structure of the inflected forms of verbal adjectives is as shown in (40):

(40)

Stem: sentential			Ending
VA stem: lexical		Light verb stem	Inflexional suffix(es)
VA radical	VA thematic suffix		
<i>taka-</i>	<i>-i⁴</i>	—	<i>-0</i> [–PAST]
<i>taka-</i>	<i>-(k)i</i>	—	<i>-0</i> [–PAST]
<i>taka-</i>	<i>-ke</i>	—	<i>-reba</i>
<i>taka-</i>	<i>-ku</i>	—	— [0 PAST]
<i>taka-</i>	<i>-ku</i>	—	<i>-te</i> [0 PAST]
<i>taka-</i>	<i>-ku</i>	—	<i>-temo</i>
<i>taka-</i>	<i>-ku</i>	—	<i>-tatte</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-ta</i> [+PAST]
<i>taka-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-tar-ō</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-tar-a(ba)</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+at-</i>	<i>-tar-i</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+ar-</i>	<i>-ō</i>
<i>taka-</i>	<i>-k(u)</i>	<i>+ar-</i>	<i>-e</i>

(ii) The VA radical is the element that encodes the lexical meaning specific to each verbal adjective. It can appear independently as a constituent of derived or compound words — for

⁴ Given that *yo-si* and *na-si*, the classical forms of the verbal adjectives *yo-i*, *i-i* "to be good" and *na-i* "(there) not to be" survive in fossilised forms in modern Japanese, it would be also possible to assume *-si* as the underlying form, with *s-* being deleted on the surface in all but exceptional cases.

example, *taka-* in *taka-sa* "height", *taka-mi* "loftiness", *taka+nozomi* "high hope" and *taka+dai* "high platform" — but it cannot, on its own, be used as a syntactic constituent belonging to the category VA at the sentential level — for example, **Kare wa se ga taka* "He is tall"; **Asoko ni se no taka otoko ga iru* "There is a tall man over there"; **Koko kara taka sobieru tō ga mieru* "From here, a tower rising high can be seen"; **Se wa taka-reba ii to yū wake de wa nai* "It is not always the case that it is good if the height is tall".

(iii) The function of the VA thematic suffix $-i \approx -(k)i \approx -ku \approx -ke$ is to licence the VA radical as a syntactic constituent of category VA within sentential phrase structure. As noted in (ii), *taka-* on its own cannot be used as a VA in a sentence. Only when it combines with $-i$, $-(k)i$, $-ku$ or $-ke$ — forming *taka-i*, *taka-(k)i*, *taka-ku* or *taka-ke*, for example — does it become syntactically eligible to function as a constituent of category VA — e.g. *Kare wa se ga takai*; *Asoko ni se no takai otoko ga iru*; *Koko kara takaku sobieru tō ga mieru*; *Se wa takake-reba ii to yū wake de wa nai*.

(iv) The form in which the VA thematic suffix appears — $-i$, $-(k)i$, $-ku$ or $-ke$ — is determined by the syntactic environment in which the VA stem occurs, as shown in (41)-(44):

- (41) When a VAP headed by a VA stem serves as the complement of a TP headed by the inflexional suffix *-reba*: → ***-ke***
- (42) When a VAP headed by a VA stem serves as the complement of a TP headed by $-o$ [–PAST], and that TP is embedded within an NP: → ***-(k)i***
- (43) When a VAP headed by a VA stem serves as the complement of a TP headed by $-o$ [–PAST], and that TP is not embedded within an NP: → ***-i***
- (44) In all other cases: → ***-ku***

(v) At the surface level, $-ku$ exhibits the phonological alternation $[-ku] \approx [-k]$, with vowel deletion occurring only when the VA stem combines with the stem *ar-* and its allomorphs of the light verb *ar-u*, resulting in the form $[-k]$. This vowel deletion can be taken to indicate that the VA stem in $-ku$ and the light verb stem *ar-* have come to form a single compound stem at the sentential level.

(vi) As shown in Section 5, there are significant structural parallels between the inflected forms of verbal adjectives — e.g. *takai* and its classical form *takasi* — and those of verbs, especially vowel-stem verbs — e.g. *nobiru* and its classical form *nobu*. Here, the vowel-stem verb *kuru* "to come" is further examined, and the morphological structure of its inflected forms, semantically

corresponding to those of the verbal adjective *takai* exemplified in (40), is shown in (45). Again, a strong parallelism in morphological structure can be observed:

(45)

V stem		Ending
V radical	V thematic suffix	Inflexional suffix(es)
<i>k-</i>	<i>-u</i>	<i>-ru</i> [–PAST]
<i>k-</i>	<i>-u</i>	<i>-ru</i> [–PAST]
<i>k-</i>	<i>-u</i>	<i>-reba</i>
<i>k-</i>	<i>-i</i>	— [0 PAST]
<i>k-</i>	<i>-i</i>	<i>-te</i> [0 PAST]
<i>k-</i>	<i>-i</i>	<i>-temo</i>
<i>k-</i>	<i>-i</i>	<i>-tatte</i>
<i>k-</i>	<i>-i</i>	<i>-ta</i> [+PAST]
<i>k-</i>	<i>-i</i>	<i>-tar-ō</i>
<i>k-</i>	<i>-i</i>	<i>-tar-a(ba)</i>
<i>k-</i>	<i>-i</i>	<i>-tar-i</i>
<i>k-</i>	<i>-o</i>	<i>-jō</i>
<i>k-</i>	<i>-o</i>	<i>-i</i>

In vowel-stem verbs, the stem-final vowels — *-u* $\approx$ *-i* $\approx$ *-o* in the inflected forms of the verb *k-u-ru* as well as *-i* in those of the verb *nob-i-ru* in (34) and *-u* $\approx$ *-i* in those of the corresponding classical verb *nob-u-0* in (35) — can be understood as functioning as the thematic suffix.

(vii) As discussed in Section 6, in the surface negative forms of verbal adjectives such as *takaku#nai-0*, *takaku#nak+at-ta*, *takaku#nak+ar-ō*, *takaku#nake-reba*, the constituents which are morphologically autonomous words such as *nai-0*, *nak+at-ta*, *nak+ar-ō*, *nake-reba* are assumed to be derived from the underlying strings such as **ara-nai-0*, **ara-nak+at-ta*, **ara-nak+ar-ō*, **ara-nake-reba*, due to the obligatory suppletion of the negative forms of the light verb *ar-u* by the inflected forms of the VA *nai*. Thus, the hypothetical underlying forms corresponding to the above surface forms are **[takaku#ara-nai-0]*, **[takaku#ara-nak+at-ta]*, **[takaku#ara-nak+ar-ō]*, **[takaku#ara-nake-reba]*, which exhibit the same structure — that is, **stem-negator-ending** — as the verbal negative forms such as *[tabe-nai-0]*, *[tabe-nak+at-ta]*, *[tabe-nak+ar-ō]*, *[tabe-nake-reba]*, apart from the difference in the degree of complexity of the stems **takaku#ara-* and *tabe-*.
