

ATB movement and non-structural Case in Modern Greek

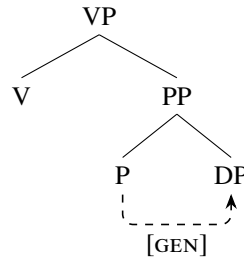

Doreen Georgi, Lefteris Paparounas, and Martin Salzmann

Non-structural case – case idiosyncratically associated either with particular verbs, or with particular thematic roles (Woolford 2006) – has received two kinds of analyses in previous literature. Under one approach, arguments bearing non-structural case are DPs of the ordinary sort, receiving a (perhaps special) case feature by a (verbal) head (1); under a different conception, the relevant arguments have a special categorial status, being encapsulated in a shell whose head is either the true case assigner such as the P in (2) (Řezáč 2008, Landau 2010, Alexiadou et al. 2014), or the bearer of Case K (Bittner & Hale 1996, Bayer et al. 2001, Deal 2025).

(1) *Plain DP*

(2) *Encapsulated DP*

We argue that both representations of non-structural case must be countenanced in the grammar, because both are found within a single language. We argue that the class of morphological genitives in Greek is syntactically not uniform, with some genitives corresponding to (1), and others to (2); this argument is based on a set of novel observations concerning the (in)compatibility of the different genitives under ATB movement. We show how the existence of two distinct representations of non-structural Case allows us to explain these observations and to unify them with previously-noted asymmetries between the genitive classes concerning clitic doubling/cliticization and the possibility of alternating with a goal PP (Anagnostopoulou & Sevdali 2020). In pursuing this unification, the analysis also makes crucial use of independently motivated thematic differences associated with the distinct genitives of Greek.

1. Background

The literature on Modern Greek, both descriptive and theoretical, recognizes three classes of genitive:

- **Class 1:** marks the **indirect object of ditransitive verbs**
e.g. *stelno* ‘send’, *đino* ‘give’ (see, e.g., Anagnostopoulou 2003: 12)
- **Class 2:** marks the **object of certain monotransitives**
e.g. *epitiðeme* ‘attack’, *tilefono* ‘telephone’, *milao* ‘talk to’ (Anagnostopoulou 2003: 323: fn. 2, Holton et al. 2012: 249, Anagnostopoulou & Sevdali 2020: 994)
- **Class 3:** marks the **object of a distinct set of monotransitives**, all high-register/archaic verbs¹
e.g., *iperisçio* ‘prevail over’, *epofelume* ‘benefit from’ (see, e.g., Anagnostopoulou 2003: 68: (106), 323: fn. 2, Holton et al. 2012: 338, Anagnostopoulou & Sevdali 2020: 994f.)

* Doreen Georgi, Universität Potsdam, doreen.georgi@uni-potsdam.de. Lefteris Paparounas, Université du Québec à Montréal, paparounas.lefteris@uqam.ca. Martin Salzmann, Universität Potsdam, salzmann2@uni-potsdam.de.

The basis for this tripartite classification is syntactic. Although the three types of genitives are always realized in the same way, clitic doubling and the possibility of alternating with goal PPs reveal a syntactic split. Class 1 and 2 verbs pattern distinctly from class 3 with respect to these phenomena; each class is moreover associated with disjoint sets of verbs.

(3) and (4) illustrate the relevant facts for genitives of classes 1 and 2. The *a.* examples show that Class 1 and 2 genitives can be cliticized (CL)/clitic doubled (CLD). The *b.* examples show that these genitives alternate with goal PPs.

(3) Class 1

- a. **(Tu)** estila **(tu Jani)** yrama.
3SG.M.GEN send.PST.1SG the.GEN John.GEN letter.ACC
'I sent John/him a letter.' ✓cliticization/clitic doubling (e.g., Anagnostopoulou 2003: 9)
- b. Estila **sto Jani** yrama.
send.PST.1SG to.the.ACC John.ACC letter.ACC
'I sent a letter to John.' ✓alternation with a PP (e.g., Anagnostopoulou 2003: 15)

(4) Class 2

- a. **(Tu)** epiteθika **(tu Jani).**
3SG.M.GEN attack.PST.1SG the.GEN John.GEN
'I attacked John/him.'
✓cliticization/clitic doubling (see Anagnostopoulou & Sevdali 2020: 994)
- b. Epiteθika **sto Jani.**
attack.PST.1SG to.the.ACC John.ACC
'I attacked John.' ✓alternation with a PP (see Anagnostopoulou 2003: 323, fn. 2)

(5) shows that Class 3 genitives do not cliticize/clitic double and do not alternate with PPs.

(5) class 3

- a. **(*Tu)** iperisçisa **(tu Jani).**
3SG.M.GEN prevail.over.PST.1SG the.GEN John.GEN
'I prevailed over John/him.'
*cliticization/clitic doubling (Anagnostopoulou & Sevdali 2020: 995)
- b. *Iperisçisa **sto Jani.**
prevail.over.PST.1SG to.the.ACC John.ACC
'I prevailed over John.' *alternation with a PP (Holton et al. 2012: 338)

While the facts motivating the different classes have been known for some time, there is no concrete proposal that accounts for the asymmetries. We will now show that the same split is found in ATB-movement, which treats Classes 1 and 2 on a par to the exclusion of Class 3. This observation paves the way for a unifying analysis of the dichotomy between the genitive classes that makes crucial reference to the category of the case-bearing element.

2. The pattern in ATB-movement

As in other languages (see, e.g., Franks 1995, Citko 2005, Hartmann et al. 2016), ATB-movement in Modern Greek requires Case-matching, being grammatical if the same case is assigned in both conjuncts

¹ Class 3 genitives are part of the learned stratum of the vocabulary: most of the verbs assigning Class 3 were coined as part of the archaizing *katharevousa* movement (see Anagnostopoulou & Sevdali 2020: fn. 8) and very likely enter the vocabulary of native speakers in the context of secondary education and engagement with formal registers. We nonetheless see no reason not to treat them as legitimate objects of study, since their behavior is fully systematic: in particular, we have encountered no literate speaker of Greek who does not have clear-cut judgments on their core syntactic behavior with respect to, e.g., clitic doubling, discussed in previous literature and below. It is important to clarify that what is seen as high-register by many speakers is usually the combination of particular verbs with a genitive object, and not the verbs themselves. Thus, there is nothing affected or archaic about intransitive *iγume* 'lead' and its derivatives (e.g. *proiyume* 'come first'); it is when the relevant verbs take a genitive object (thus 'lead someone' and 'precede someone') that the resulting combination is perceived as high-register.

as in (6), but ungrammatical if the cases differ as in (7):²

- (6) **pjon** ðen eçi kanenas endopisi_{acc} __ ke katiyorisi_{acc} __ ?
 who.ACC NEG have.3SG nobody.NOM locate.PFV and accuse.PFV
 ‘Who has nobody located and accused?’ Acc+Acc
- (7) ***pjon**/***pjanu** ðen eçi kanenas telefonisi_{gen} __ ke katiyorisi_{acc} __ ?
 who.ACC/who.GEN NEG have.3SG nobody.NOM telephone.PFV and accuse.PFV
 ‘Who has nobody telephoned and accused?’ Gen+Acc

Note that all our ATB examples use coordination below the perfect auxiliary and a negative subject with scope over both conjuncts. These ingredients rule out a non-ATB-parse involving full CP coordination combined with wh-drop and pro-drop in the second conjunct (along the lines of *Whom did X phone and whom did X accuse*). We do not show both conjunct orders as the choice between them does not systematically affect the acceptability of our examples.

Now, what is at issue given the discussion in the preceding section is the behavior of the three genitive classes under ATB movement. Since the different genitives are always realized identically, we may expect them to all freely combine with each other under ATB movement (cf. footnote 2).

Remarkably, this is not the case. While classes 1 and 2 do freely combine with each other (8), class 3 combines with neither class 1 (9) nor class 2 (10).³

- (8) pjanu ðen eçi kanenas stili __ ýrama ke epiteði __ ?
 who.GEN NEG have.3SG nobody.NOM send.PFV letter.ACC and attack.PFV
 ‘Who has nobody sent a letter to and attacked?’ Class 1 + Class 2
- (9) ??pjanu ðen eçi kanenas stili __ ýrama ke iperisçisi __ ?
 who.GEN NEG have.3SG nobody.NOM send.PFV letter.ACC and prevail.over.PFV
 ‘Who has nobody sent a letter to and prevailed over?’ Class 1 + Class 3
- (10) ??pjanu ðen eçi kanenas epiteði __ ke iperisçisi __ ?
 who.GEN NEG have.3SG nobody.NOM attack.PFV and prevail.over.PFV
 ‘Who has nobody attacked and prevailed over?’ Class 2 + Class 3

Unsurprisingly, combining members of the same class always yields a well-formed result:

- (11) pjanu ðen eçi kanenas stili __ ýrama ke ðosi __ ðora?
 who.GEN NEG have.3SG nobody.NOM send.PFV letter.ACC and give.PFV gift.ACC.PL
 ‘Who has nobody sent a letter to and given gifts to?’ class 1 + 1
- (12) pjanu ðen eçi kanenas telefonisi __ ke milisi __ ?
 who.GEN NEG have.3SG nobody.NOM telephone.PFV and talk.PFV
 ‘Who has nobody telephoned and talked to?’ Class 2 + 2
- (13) Pjanu ðen eçi kanenas projitiði __ ke iperisçisi __ ?
 who.GEN NEG have.3SG nobody.NOM precede.PFV and prevail.over.PFV
 ‘Who has nobody preceded and prevailed over?’ Class 3 + 3

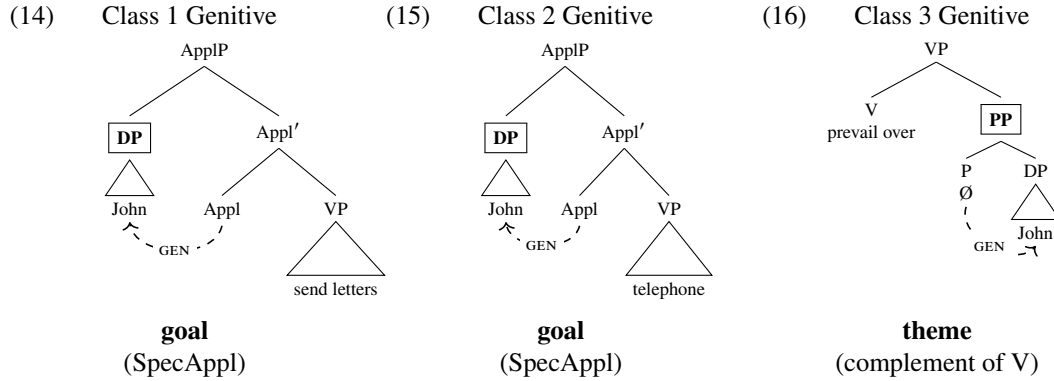

It seems crucial that the matching requirement on ATB movement marches in lockstep with cliticization/clitic doubling and the availability of PP alternants: all phenomena diagnose a split between Classes 1 and 2 on the one hand, and Class 3 on the other. In the next section, we argue that these novel observations on ATB movement crucially enable an analysis that provides a unified understanding of this seemingly disparate range of phenomena.

² In many languages, case mismatches is salvaged by syncretism. The effect of syncretism is difficult to illustrate in Modern Greek because syncretic cases cannot be constructed: while some nouns syncretize (e.g. for GEN and ACC), determiners do not, and bare nouns, independently rare in Greek, do not make for good targets of A' movement.

³ All examples were constructed by the native speaker co-author and additionally judged by three consultants. We have additionally received judgments from seven more Greek speakers, some at major linguistics conferences; on the whole, the judgments from these additional speakers converge with the empirical picture in the main text for our core examples. Some points of variation remain in that certain speakers report an amelioration with the reverse conjunct order or other type 3 verbs. We will leave a full exploration of this variation for another occasion

3. Proposal

We propose that the asymmetries between class 1/2 and class 3 genitives can be reduced to a difference in category and thematic role, as illustrated in (14)–(16). In particular, Class 1+2 genitives are plain DPs, while class 3 genitive-marked DPs are encapsulated in a PP headed by a silent preposition. Additionally, superimposed on this categorial difference is a thematic one: class 1/2 genitives are goals in Spec,ApplP, while class 3 genitives are themes – complements of the verb.

The analysis thus draws distinctions between the different genitives along two dimensions: category, and thematic role. We proceed to show that each of these components is necessary in explaining the empirical picture: the difference in category accounts for the facts from ATB movement and cliticization/clitic doubling, while the thematic distinction derives the differential availability of PP alternants.

3.1. The categorial difference

The categorial difference – classes 1/2 as DPs, class 3 as a PP – suffices to derive the asymmetry observed in ATB movement. As in other languages, ATB-movement in Greek requires the extracted elements to match in category; the following paradigm illustrates.

In (17), an accusative-assigning verb (17-a) is combined with a verb that takes a PP complement (17-b); the head of this PP assigns accusative to the complement of P. (17-c) combines the two verbs under ATB-movement, and shows that a PP filler that matches the requirements of the PP-selecting verb cannot be related to the accusative-assigning verb in the other conjunct. As (17-d) shows, an accusative-marked filler that is compatible with the gap of the accusative-assigning verb cannot simultaneously be related to the second gap inside the PP, even though the preposition itself assigns accusative. The ungrammaticality of (17-d) is due to the fact that PPs are islands in Greek, and subextraction of the accusative DP, stranding the preposition, is thus generally impossible (Merchant 2001). Nothing would change if the conjunct order were reversed in (17-c/d).

- (17)
- | | | |
|----|---|--------|
| a. | Xrimatoðotisa ton ayona.
fund.PST.1SG the.ACC race.ACC
'I funded the race.' | Acc |
| b. | Simetixa ston ayona.
participate.PST.3SG in.the.ACC race.ACC
'I participated in the race.' | P+Acc |
| c. | *Se pjon ayona ðen eçi kanis xrimatoðotisi __ ke simetasçi __?
in which.ACC race.ACC NEG has nobody.NOM fund.PFV and participate.PFV
'*In which race has nobody funded and participated?' | Acc+PP |
| d. | *Pjon ayona ðen eçi kanis xrimatoðotisi __ ke simetasçi (se) __?
which.ACC race.ACC NEG have.3SG nobody.NOM fund.PFV and participate.PFV in
'Which race has nobody funded and participated in?' | Acc+PP |

Whenever a class 3 genitive undergoes ATB extraction along with a class 1/2 genitive, the analysis above will predict the outcome to correspond to the derivation of (17-c) or (17-d), reducing the effect to an independently observable categorial mismatch.

Note that the unacceptability of combining a class 3 genitive with a class 1/2 genitive cannot be reduced to a thematic mismatch between goal and theme; it is well-established in the literature on ATB-movement that what matters is not thematic identity but thematic prominence, see Franks (1993: 515):

- (18) a. “In any ATB construction, the gaps must pertain either to most prominent or to not most prominent arguments, consistently across all the conjuncts.” (ibid., p.515)
 b. agent > exp > theme > goal/source/loc > manner/ time

In all our examples, we are extracting arguments that are not most prominent, i.e., objects, yet combining class 1/2 (goal) + class 3 (theme) is ungrammatical.

The categorial difference also suffices to explain the asymmetry between classes 1/2 and class 3 with respect to cliticization/clitic doubling. Importantly, the explanation here cuts across different proposed analyses of these phenomena.

If cliticization/doubling involves Agree (e.g., Suñer 1988, Paparounas & Salzmann 2024), a probe should be able to access DPs but not probe into PPs, leading to cliticization/doubling only with Class 1/2 genitives, but not Class 3. Similar conclusions emerge for movement-based analyses whereby either a clitic head or a whole DP would move, in the latter case followed by merger/rebracketing between the D-head of the DP and the verb (see, e.g., Anagnostopoulou 2003, Rezac 2008, Harizanov 2014, Arregi & Nevins 2012, Kramer 2014, Preminger 2019). Across movement-based analyses, the PP shell will block movement of the clitic (Big-DP-approaches), movement the D head (head-movement approaches), or object shift of the doubled DP (A-movement approaches). Clearly, the split can also be derived by analyses combining movement and Agree (e.g., Angelopoulos 2019).

3.2. Thematic distinctions

While the categorial distinction between DP and PP genitives suffices to account for the patterns in ATB movement and clitic doubling/cliticization, we argue that the differential availability of PP alternants follows from a thematic difference: Class 2 genitives are goals on a par with Class 1 genitives, projected in Spec,ApplP, while Class 3 genitives are themes that occur within a PP-complement of V. Since goals generally alternate with PPs in the language, while themes do not, this additional step allows us to make the right cut. Importantly, this thematic difference can be established quite independently of the phenomena discussed above. It is uncontroversial that Class 1 genitives should be classified as goals, so we proceed to offer independent evidence for an approach treating Class 2 genitives as goals, and Class 3 genitives as Themes.

Class 2 verbs in Greek, shown in (19), belong to a cross-linguistically stable set of verbs that often assign oblique/dative case, with most of them being verbs of transfer (Blume 1998, Pineda 2020; see also Torrego 2010: 460-462 and Cuervo 2003: 192-194). That this class is encyclopedically more or less coherent, involving transfer, provides a first clue that the internal arguments of these verbs may be on a par with *bona fide* goals of ditransitive predicates.

- (19) List of verbs that assign genitive of class 2 in Modern Greek
tilefono ‘telephone’, *milao* ‘talk to’ (Anagnostopoulou & Sevdali 2020: 994), *apantao* ‘answer’, *apokrinome* ‘respond’, *apefthinome* ‘address, appeal’, *ynefo* ‘nod’ (Holton et al. 2012: 249); *epititheme* ‘attack’,⁴ *sfirizo* ‘whistle at’, *kornaro* ‘honk at’, *yavjizo* ‘bark at’, *fonazo* ‘shout at’

Interestingly, that classes 1 and 2 share key thematic properties can be diagnosed fairly directly. Like Class 1 genitives (20), Class 2 genitives (21) display Oehrle effects (Oehrle 1976): although they alternate with PPs, only the PP variant can denote an inanimate entity, and the DP variant cannot. For English and languages like it, contrasts like (20) are standardly taken to suggest that the DP goal alternant of the

⁴ *epititheme* ‘attack’ is diachronically decomposable into *epi* ‘against’ + *titheme* ‘set oneself, position oneself’. It thus literally means ‘set oneself against someone’; hence classifying its object as a goal is plausible.

dative alternation is assigned the semantics of a possessor/recipient, animate by definition (e.g. Harley 2002); the same analysis must be extended to the sole argument of the Class 2 verb in (21).

- (20) class 1 (Anagnostopoulou 2003: 11, ex. (11))
- a. I Ilektra estile ena ðema sti Galia.
the.NOM Electra.NOM send.PST.3SG one.ACC parcel.ACC to France
'Electra sent a parcel to France.'
- b. #I Ilektra estile tis Galias ena ðema.
the.NOM Electra.NOM send.PST.3SG the.GEN France.GEN one.ACC parcel.ACC
Intended: '#Electra sent France a parcel.'
- (21) class 2
- a. I Ilektra telefonise sti Galia.
the.NOM Electra.NOM telephone.PST.3SG to.the.ACC France
'Electra put in a call to France.'
- b. #I Ilektra telefonise tis Galias.
the.NOM Electra.NOM telephone.PST.3SG the.GEN France.GEN
Intended: 'Electra called France.'

A final argument for treating class 2 genitives as goals comes from possessor extraction. Possessor extraction is generally allowed in Modern Greek (see, Horrocks & Stavrou 1987, Angelopoulos & Michelioudakis 2023). The following example shows extraction from a direct object:

- (22) Pjanu iðes [ton jo ___]?
who.GEN see.PST.2SG the.ACC son.ACC
'Whose son did you see?'

Extraction from both class 1 and class 2 genitives is impossible, though:

- (23) *Pjanu estiles [tu ju ___] ena yrama?
who.GEN send.PST.2SG the.GEN son.GEN one.ACC letter.ACC
'Whose son did you send a letter to?' class 1
- (24) *Pjanu telefonises [tu ju ___]?
who.GEN telephone.PST.2SG the.GEN son.GEN
'Whose son did you telephone?' class 2

The impossibility of possessor extraction follows straightforwardly from class 1 and 2 genitives being goals projected as specifiers in Spec,ApplP.⁵ Further support for such a treatment of class 2 genitives comes from the fact that some verbs can take an optional clausal/DP theme argument in complement position (which in turn argues against the conflation analysis in Pineda 2020 where the verb's complement is a bare N that incorporates into the verb and hence precludes the merger of a distinct complement):

- (25) Apadisa / apokriθika tis Marias oti ðe tha erθo.
reply.PST.1SG respond.PST.1SG the.GEN Mary.GEN COMP NEG FUT come.1SG
'I replied to Mary that I won't be coming.'
- (26) Sfiriza tis Marias ena paljo trayuði.
whistle.IPPFV.PST.1SG the.GEN Mary.GEN one.ACC old.ACC song.ACC
'I was whistling an old song to Mary.'

⁵ Reducing the ban on possessor extraction with class 1/2 genitives to the Condition on Extraction Domains (Huang 1982) is arguably not possible because extraction from postverbal subjects is acceptable for many speakers (previous literature reports conflicting judgments; compare, e.g., Spyropoulos & Philippaki-Warbuton 2001: 164 and Kotzoglou 2007: 129 with Lekakou 2005: 19-21 and Alexiadou & Anagnostopoulou 1999: 27; see also Alexiadou & Anagnostopoulou 2004: 135, who report that, even for speakers who dislike possessor extraction from postverbal subjects, the effect is sometimes not very strong). Thus, not all specifiers appear to behave the same. Note that the Greek pattern is similar to a pattern in German whereby indirect objects are completely opaque to subextraction (Müller 1995: 44), while (unergative/transitive) subjects show some transparency, see, e.g., Haider (2010: 79-82).

In contrast to class 2 genitives, class 3 genitives are best classified as Themes, not Goals. (27) provides a list of the verbs assigning class 3 genitive; a first inspection suggests little lexicosemantic coherence of the kind that led us above to suspect a Goal role in class 2.

- (27) List of verbs that assign genitive of class 3 in Modern Greek
epofelume ‘benefit from’, *proighume* ‘precede’, *proedhrevu* ‘preside over’, *proiparcho* ‘pre-exist’,
iperischio ‘prevail’ (Anagnostopoulou 2003: 68f., 323, fn. 2); *iperaminome* ‘defend’ (Anagnostopoulou & Sevdali 2020: 994, ex. 14b); *diafevyo* ‘evade’, *epizo* ‘survive’, *proporevome* ‘march ahead of’; sometimes *epimelume* ‘be in charge of, take care of’ and *sterume* ‘be deprived of’ (Holton et al. 2012: 338); *iyume* ‘lead’, *epikrato* ‘overcome, win over’, *metexo* ‘participate in’,
iperexo ‘outclass’, *ipertero* ‘outperform’, *ipolipome* ‘fall short’

Importantly, the Oehrle effects that obtain with genitives of both Classes 1 and 2 do not obtain with Class 3; inanimate-denoting Class 3 genitive DPs are unproblematic (28):

- (28) Eftixos epezise tu atıçımatos.
thankfully survive.PST.3SG the.GEN accident.GEN
‘Thankfully s/he survived the accident.’

Since on our analysis class 3 genitives are encapsulated in a PP, subextracting the possessor is predicted to be impossible. This prediction is borne out:

- (29) *Pjanu proijise [tu ju ____]?
who.GEN precede.2SG the.GEN son.GEN
‘Whose son do you precede (e.g. in line)?’ class 3

Interestingly, as also pointed out in Holton et al. (2012: 339), for some speakers, the class 3 verbs *sterume* ‘be deprived of’ and *epimelume* ‘superintend’ alternate between genitive and accusative objects; crucially, subextraction is only possible with accusative in these cases:

- (30) a. Pjanu epimelithikes [to yamilio parti ____]?
who.GEN superintend.PST.2SG the.ACC bridal.ACC party.ACC
b. *Pjanu epimelithikes [tu yamilu parti ____]?
who.GEN superintend.PST.2SG the.GEN bridal.GEN party.GEN
‘Whose wedding party were you in charge of?’

This asymmetry can be made sense of if the accusative objects are DP complements of V, while the class 3 genitives are within PP complements of V. Thus, all genitives disallow possessor extraction, but for different reasons: Class 1/2 genitives disallow it because they are in Spec,ApplP, while class 3 genitives block it because they are encapsulated in a PP shell.

4. Conclusion and extensions

We have argued that positing a categorial difference between the Class 1 and 2 genitives of Modern Greek on the one hand, and Class 3 on the other, derives the novel observation that the classes are differentially combinable under ATB movement. Coupled with independently motivated thematic differences, we have shown how the difference in category makes it possible to unify these observations with previously established, yet unexplained, differences in cliticization/clitic doubling and PP alternation between the classes.

The theoretical upshot of the overall picture we draw is that both representations of non-structural case put forth in previous literature must be allowed into the grammar: some non-structural genitives are DPs, while others are DPs encapsulated in a PP shell, with this split present even in the same language.⁶

⁶ Class 2 genitives have interesting consequences for the treatment of genitives in Greek more generally. Given that these genitives occur in the absence of a case-competitor, they cannot be treated as a dependent case as has been proposed for the class 1 genitives of ditransitives in Anagnostopoulou & Sevdali (2020). Rather, they must be inherent cases assigned by Appl. Given that Class 1 and 2 genitives pattern the same in all relevant respects, a

Our discussion also has potential diagnostic utility, establishing category mismatches in ATB movement as a probe for the representation of non-structural cases elsewhere. We briefly mention two extensions of the basic picture sketched here, reserving fuller discussion for a longer paper.

Firstly, our ATB diagnostic yields interesting conclusions when applied to other corners of Greek where a categorial distinction between arguments is independently evidenced. In particular, verbs like *ðiðasko* ‘teach’ and *serviro* ‘serve’ support three Case frames (Anagnostopoulou 2003: 14), illustrated in (31) for ‘serve’: the direct object (here *cake*) is always accusative, while the indirect object argument (here *John*) can appear as a genitive, a PP, or, interestingly, an accusative.

- (31) Servira { tu Jani / sto Jani / to Jani } turta.
 serve.PST.1SG the.GEN John.GEN to.the.ACC John.ACC the.ACC John.ACC cake.ACC
 ‘I served John cake.’

Anagnostopoulou (2001) and Anagnostopoulou & Sevdali (2020) argue that the direct object is an NP in the ACC-ACC frame, but a DP in the GEN-ACC and PP-ACC frames. As these authors discuss, the categorial difference helps explain a range of properties specific to the ACC-ACC frame; for instance, the direct object in the ACC-ACC frame must be obligatorily bare/indefinite, and can neither be cliticized nor clitic-doubled.

The idea that the direct object differs in category between the GEN-ACC and PP-ACC frames on the one hand, and the ACC-ACC frame on the other, raises a clear expectation in light of our preceding discussion: if the differences between the two kinds of objects follow from a difference in category, then the direct object of a regular transitive like *buy* should only be able to combine in an ATB fashion with the direct object of a ditransitive like *serve* if the latter verb is in the GEN-ACC and PP-ACC frame (category matching), but not if it is in the ACC-ACC frame (category mismatch). Strikingly, this prediction is borne out:

- (32) **Ti** ðen eçi kanis aȝorasi_{acc} DP ke serviri tu Jani / sto
 what.ACC NEG has nobody.NOM bought and served the.GEN John.GEN to.the.ACC
 Jani / *ton Jani DP/DP/NP?
 John.ACC the.ACC John.ACC
 ‘What has nobody bought and served John?’

A further expectation in line with this state of affairs is that it should be possible to ATB-move the direct objects of ditransitive verbs that both appear in the ACC-ACC frame, since both objects are NPs (no category mismatch). This prediction is borne out as well:

- (33) **Ti** ðen eçi kanis serviri ti Maria NP ke taisi ton Jani NP?
 what.ACC NEG has nobody.NOM served the Mary.ACC and fed the John.ACC
 ‘What has nobody served Mary and fed John?’

A second domain to which our diagnostic can be fruitfully extended involves other phenomena where category matching has been argued to play a role. As a representative example, consider Right Node Raising (RNR), a phenomenon whose prospects for assimilation to ATB movement has long been debated (see e.g. Barros & Vicente 2011).

RNR sentences where the shared object is a genitive are always grammatical when the verbs in the two conjuncts belong to the same class; for brevity, we illustrate solely with two Class 2-assigning verbs:

- (34) Kanenas ðen eçi milisi prosopo me prosopo ke telefonisi **tu**
 nobody.NOM NEG have.3SG speak.PFV face with face and telephone.PFV the.GEN
ex0ru tu.
 enemy.GEN 3SG.M.GEN
 ‘Nobody has spoken face-to-face to and telephoned **their enemy**.’ class 2 + class 2

Crucially, RNR sentences with genitives of different category turn out to be grammatical as well; we illustrate with a combination of Class 2 and Class 3.

unifying analysis suggests itself. This in turn would favor an inherent case analysis of Class 1 genitives as well.

- (35) Kanenas ðen eçi milisi prosopo me prosopo ke iperisçisi **tu**
 nobody.NOM NEG have.3SG speak.PFV face with face and prevail.over.PFV the.GEN
exθru tu.
 enemy.GEN 3SG.M.GEN
 ‘Nobody has spoken face-to-face to and prevailed over **their enemy**.’ class 2 + class 3

Recall now that the situation in (35) – where a Class 3 genitive combines with a genitive of a different class – is exactly the situation that we found to be systematically ruled out in Greek ATB movement, recall (9) and (10). This observation speaks against an assimilation of RNR to ATB movement in Greek, and against a role for movement in Greek RNR more generally. Note that under a movement analysis of (35), the dative DP in the first conjunct would move to the complement position of the silent preposition in the second conjunct, in violation of the extension condition. These observations converge with independent evidence against the involvement of movement in Greek RNR, notably the insensitivity of the phenomenon to locality constraints.

Similar extensions can be pursued to phenomena such as Parasitic Gaps (which behave on a par with ATB in Greek, suggesting a role of category matching in this phenomenon too; see especially Hewett 2025). We take up these further extensions in the longer paper.

Finally, the diagnostic reasoning we apply here to the genitives (and accusatives) of Greek in ATB movement deserves to be extended to non-structural cases in other languages. Preliminary investigations in the domain of ATB-movement suggest that German datives that have been argued to instantiate a split between DPs and PPs (McFadden 2004: 113, 120ff.) do freely combine in ATB movement, see (36):

- (36) **Wem** würde keiner __ einen Orden verleihen_{DP} und seine Kinder __ aussetzen_{PP}?
 who.DAT would no.one a medal award.INF and his children expose.to.INF
 ‘Who would no one award a medal to and expose his children to?’

Similar results emerge in a preliminary investigation of Russian datives (Masha Privizentseva, p.c.), while Monica Irimia (p.c.) informs us that Romanian behaves more like Greek. At a minimum, these comparisons suggest that posited categorial differences between different non-structural cases in the same language are most reliable when they align with independent syntactic diagnostics sensitive to category.
