

Reverse Entailment in Adjectival Categorization: A Diagnostic for Syntactical Adjective Entities

Author: Maks Panner

Affiliation: Independent Researcher

Date: September 28, 2025

Abstract: This position paper extends the concept of reverse entailment to adjectives, proposing a bidirectional inference mechanism that formalizes how derived adjective forms (e.g., comparatives, superlatives, nominalized derivatives) entail backward to confirm the base form's adjectival properties. I introduce the **Reverse Entailment Diagnostic (RED)**, adapted for adjectives, as a tool to prove that lexical and syntactic entities can act as "syntactical adjective entities" in dynamic contexts. Using examples like "square/quadrilateral," "to book carefully," and "her house," I demonstrate how RED reveals category flexibility, challenging rigid lexicalist frameworks and supporting usage-based models. This has implications for syntax, semantics, and cognitive linguistics, emphasizing role-driven categorization and listener interpretation.

Keywords: reverse entailment, adjectivalization, syntactic categorization, dynamic linguistics, parts of speech

1. Introduction

In linguistic theory, adjectival categorization has often been treated as lexicon-driven, with adjectives fixed as modifiers of nouns or predicatives (Chomsky, 1970). However, dynamic approaches like Distributed Morphology (DM; Halle & Marantz, 1993) and Construction Grammar (Goldberg, 1995) suggest adjectives emerge from syntactic roles and semantic contexts. This paper formalizes **adjective reverse entailment**, a bidirectional mechanism where derived adjective forms imply the base's adjectival potential.

I introduce the **Reverse Entailment Diagnostic (RED)**, adapted for adjectives, to test if entities (words, phrases) can act as "syntactical adjective entities." RED builds on noun reverse entailment but focuses on adjectival properties like gradability. This framework supports non-lexicalist models, showing categories are holistic and distributed.

The paper proceeds: Section 2 defines adjective reverse entailment and RED; Section 3 provides examples; Section 4 discusses implications; Section 5 concludes.

2. Adjective Reverse Entailment and the Reverse Entailment Diagnostic (RED)

2.1 Adjective Reverse Entailment

Standard entailment is unidirectional (e.g., “redder” entails “red”). Adjective reverse entailment reverses this: from a derived form Y (e.g., comparative, superlative), we infer the base X’s adjectival properties (e.g., gradability, modification).

Formally:

- If Y (derived adjective, e.g., “reddest”) exists, then Y reverse-entails X (base) as adjectival (e.g., “red” describes a property).
- This bidirectional reasoning reveals flexibility: the derived form “folds back” to confirm X’s adjectival status in non-derived contexts.

In DM, roots ($\sqrt{X}$) are neutral, gaining adjectival status via heads (a for adjective, with features like +comparative); reverse entailment infers through derivations. In Construction Grammar, constructions (e.g., [NP is Adj-er]) assign adjectival status, with reverse entailment confirming for the base.

2.2 The Reverse Entailment Diagnostic (RED)

RED for adjectives tests if an entity acts as a syntactical adjective entity:

1. Apply an adjective derivation (e.g., comparative -er, superlative -est, adverbial -ly).
2. If the form is grammatical or interpretable, reverse-entail to the base's adjectival status.
3. Test in adjectival roles (e.g., attributive, predicative) to confirm.

RED proves adjectival flexibility for non-adjectival bases, emphasizing roles.

3. Examples of Adjective Reverse Entailment and RED

3.1 Square/Quadrilateral (Geometric Terms)

Base: "Square" (geometric noun/adjective hybrid).

- Derived: "Squarer" (comparative, e.g., "This shape is squarer than that"); "squarest" (superlative, e.g., "The squarest quadrilateral is a square").
- Reverse Entailment: "Squarest" entails "square" is gradable (adjectival property); "squarer" entails comparison. This folds back to "square" in attributive roles (e.g., "square table" as "square-like table").
- RED Test: In "The table is square," "square" is predicative (adjectival). Derived "squarely" (adverb) confirms adjectival status, reverse-entailing "square" as a syntactical adjective entity, even as a quadrilateral term (specific "square" entails general "quadrilateral," but reverse for adjectival properties).

3.2 To Book Carefully (Infinitive Phrase)

Base: “To book carefully” (verbal phrase).

- Derived: Adjectival “booky” (e.g., “booky cafe”); comparative “bookier,” superlative “bookiest” (e.g., “the bookiest plan is to book carefully”).
- Reverse Entailment: “Bookiest” entails “booky” is gradable; this folds back to “book” in the phrase as adjectival (e.g., “a book-y approach” for “to book carefully”).
- RED Test: In “The plan to book carefully is booky,” “booky” is predicative (adjectival, meaning book-like). Derived “bookily” (adverb) confirms adjectival status, reverse-entailing “to book carefully” as syntactical adjective entity when describing properties (e.g., careful booking as “booky”).

3.3 Her House (Possessive Phrase)

Base: “Her house” (nominal phrase).

- Derived: “Housier” (comparative, e.g., “This is housier than that”); “housiest” (superlative, e.g., “The housiest structure is her house”).
- Reverse Entailment: “Housiest” entails “housy” is gradable; this folds back to “house” as adjectival (e.g., “a house-y feel” for “her house’s comfort”).
- RED Test: In “Her house is housy,” “housy” is predicative (adjectival, meaning house-like). Derived “housily” (adverb) confirms adjectival status, reverse-entailing “her house” as a syntactical adjective entity when describing qualities (e.g., possession as “housy”).

4. Implications

RED for adjectives reveals dynamic branching, supporting models like DM (roots + heads) and Construction Grammar (role-driven constructions). For “book” as base, reverse entailment from “bookiest” shows adjectival flexibility, extending to phrases. This has applications in NLP for disambiguation and cognitive linguistics for thinking modes.

5. Conclusion

Adjective reverse entailment and RED formalize category flexibility, proving entities like “to book carefully” are syntactical adjective entities via derivations. This bidirectional approach is a creative contribution, bridging semantics and syntax for dynamic linguistics. Future work could apply RED to other categories or formalize it computationally.

Reverse Entailment in Adverbial Categorization: A Diagnostic for Syntactical Adverb Entities

Author: MAKS PANNER

Affiliation: Independent Researcher

Date: September 28, 2025

Abstract: This position paper extends the concept of reverse entailment to adverbs, proposing a

bidirectional inference mechanism that formalizes how derived adverb forms (e.g., nominalized derivatives, possessive constructions) entail backward to confirm the base form's adverbial properties, often tracing back to nouns. I introduce the **Reverse Entailment Diagnostic (RED)**, adapted for adverbs, as a tool to prove that lexical and syntactic entities can act as "syntactical adverb entities" in dynamic contexts. Using examples like "tomorrow," "here," and "carefully" (going back to nouns), I demonstrate how RED reveals category flexibility, challenging rigid lexicalist frameworks and supporting usage-based models. This has implications for syntax, semantics, and cognitive linguistics, emphasizing role-driven categorization and listener interpretation.

Keywords: reverse entailment, adverbialization, syntactic categorization, dynamic linguistics, parts of speech

1. Introduction

Adverbial categorization has traditionally been viewed as derived from adjectives or fixed in lexical entries (Chomsky, 1970). However, dynamic approaches like Distributed Morphology (DM; Halle & Marantz, 1993) and Construction Grammar (Goldberg, 1995) suggest adverbs emerge from syntactic roles and semantic contexts, often linking back to nouns. This paper formalizes **adverbial reverse entailment**, a bidirectional mechanism where derived adverb forms imply the base's adverbial potential, frequently tracing to nominal roots.

I introduce the **Reverse Entailment Diagnostic (RED)**, adapted for adverbs, to test if entities (words, phrases) can act as "syntactical adverb entities." RED builds on noun and adjective reverse entailment but focuses on adverbial properties like manner or location modification. This supports non-lexicalist models, showing categories are holistic.

The paper proceeds: Section 2 defines adverbial reverse entailment and RED; Section 3 provides examples; Section 4 discusses implications; Section 5 concludes.

2. Adverbial Reverse Entailment and the Reverse Entailment Diagnostic (RED)

2.1 Adverbial Reverse Entailment

Standard entailment is unidirectional (e.g., “quickly” entails “quick”). Adverbial reverse entailment reverses this: from a derived form Y (e.g., nominalized adverb), we infer the base X’s adverbial properties (e.g., manner modification), often going back to nouns.

Formally:

- If Y (derived adverb, e.g., “tomorrow’s” nominalized) exists, then Y reverse-entails X (base) as adverbial (e.g., “tomorrow” modifies time), linking to nominal roots.
- This bidirectional reasoning reveals flexibility: the derived form “folds back” to confirm X’s adverbial status in non-derived contexts, often from nouns.

In DM, roots ($\sqrt{X}$) are neutral, gaining adverbial status via heads (adv for adverb); reverse entailment infers through derivations. In Construction Grammar, constructions (e.g., [Adv is NP]) assign adverbial status, with reverse entailment confirming for the base, tracing to nouns.

2.2 The Reverse Entailment Diagnostic (RED)

RED for adverbs tests if an entity acts as a syntactical adverb entity:

1. Apply an adverb derivation (e.g., nominalization, possessive -'s/of).
2. If the form is grammatical or interpretable, reverse-entail to the base's adverbial status.
3. Test in adverbial roles (e.g., manner, location modification) to confirm, going back to nouns.

RED proves adverbial flexibility for non-adverbial bases, emphasizing roles.

3. Examples of Adverbial Reverse Entailment and RED

3.1 Tomorrow (Time Adverb, Going Back to Noun)

Base: "Tomorrow" (adverb, denoting future time; from noun root "morrow").

- Derived: Nominalized "tomorrow's" (possessive, e.g., "Tomorrow's promise is hope"); "of tomorrow" (e.g., "The hope of tomorrow is bright").
- Reverse Entailment: "Tomorrow's" entails "tomorrow" denotes an entity capable of possession (nominal property), folding back to confirm its adverbial status (modifying time, e.g., "Book tomorrow"), linking to noun root "morrow" (day as entity).
- RED Test: In "Tomorrow is another day," "tomorrow" is subject (nominalized adverb). Derived "tomorrowly" (rare adverb of adverb) confirms adverbial status, reverse-entailing "tomorrow" as a syntactical adverb entity, going back to noun (e.g., "a tomorrow" as hypothetical entity).

3.2 Here (Place Adverb, Going Back to Noun)

Base: “Here” (adverb, denoting location; from noun root “place”).

- Derived: Nominalized “here’s” (possessive, e.g., “Here’s advantage is proximity”); “of here” (e.g., “The advantage of here is convenience”).
- Reverse Entailment: “Here’s” entails “here” denotes an entity capable of possession (nominal property), folding back to confirm its adverbial status (modifying place, e.g., “Book here”), linking to noun root “place” (location as entity).
- RED Test: In “Here is where we start,” “here” is subject (nominalized adverb). Derived “herely” (rare adverb of adverb) confirms adverbial status, reverse-entailing “here” as a syntactical adverb entity, going back to noun (e.g., “a here” as hypothetical entity).

3.3 Carefully (Manner Adverb, Going Back to Noun)

Base: “Carefully” (adverb, denoting manner; from noun root “care”).

- Derived: Nominalized “carefully’s” (possessive, e.g., “Carefully’s effect is precision”); “of carefully” (e.g., “The effect of carefully is success”).
- Reverse Entailment: “Carefully’s” entails “carefully” denotes an entity capable of possession (nominal property), folding back to confirm its adverbial status (modifying manner, e.g., “Book carefully”), linking to noun root “care” (attention as entity).
- RED Test: In “Carefully is the way to book,” “carefully” is subject (nominalized adverb). Derived “carefullyly” (rare adverb of adverb) confirms adverbial status, reverse-entailing “carefully” as a syntactical adverb entity, going back to noun (e.g., “a carefully” as hypothetical entity).

4. Implications

RED for adverbs reveals dynamic branching from nouns, supporting models like DM (roots + heads) and Construction Grammar (role-driven constructions). For “book” as base, reverse entailment from “carefully” (in “to book carefully”) shows adverbial flexibility. This has applications in NLP for disambiguation and cognitive linguistics for thinking modes.

5. Conclusion

Adverbial reverse entailment and RED formalize category flexibility, proving entities like “tomorrow” are syntactical adverb entities via derivations, going back to nouns. This bidirectional approach is a creative contribution, bridging semantics and syntax for dynamic linguistics. Future work could apply RED to other categories or formalize it computationally.

Reverse Entailment in Verbal Categorization: A Diagnostic for Syntactical Verb Entities

Author: MAKES PANNER

Affiliation: Independent Researcher

Date: September 28, 2025

Abstract: This position paper extends the concept of reverse entailment to verbs, proposing a

bidirectional inference mechanism that formalizes how derived verb forms (e.g., nominalized derivatives, possessive constructions) entail backward to confirm the base form's verbal properties. I introduce the **Reverse Entailment Diagnostic (RED)**, adapted for verbs, as a tool to prove that lexical and syntactic entities can act as "syntactical verb entities" in dynamic contexts. Using examples like "book," "to book carefully," and "run," I demonstrate how RED reveals category flexibility, challenging rigid lexicalist frameworks and supporting usage-based models. This has implications for syntax, semantics, and cognitive linguistics, emphasizing role-driven categorization and listener interpretation.

Keywords: reverse entailment, verbalization, syntactic categorization, dynamic linguistics, parts of speech

1. Introduction

Verbal categorization has traditionally been viewed as lexicon-driven, with verbs fixed as predicates assigning roles (Chomsky, 1970). However, dynamic approaches like Distributed Morphology (DM; Halle & Marantz, 1993) and Construction Grammar (Goldberg, 1995) suggest verbs emerge from syntactic roles and semantic contexts. This paper formalizes **verbal reverse entailment**, a bidirectional mechanism where derived verb forms imply the base's verbal potential.

I introduce the **Reverse Entailment Diagnostic (RED)**, adapted for verbs, to test if entities (words, phrases) can act as "syntactical verb entities." RED builds on noun and adjective reverse entailment but focuses on verbal properties like argument structure. This supports non-lexicalist models, showing categories are holistic.

The paper proceeds: Section 2 defines verbal reverse entailment and RED; Section 3 provides examples; Section 4 discusses implications; Section 5 concludes.

2. Verbal Reverse Entailment and the Reverse

Entailment Diagnostic (RED)

2.1 Verbal Reverse Entailment

Standard entailment is unidirectional (e.g., “runs” entails “run”). Verbal reverse entailment reverses this: from a derived form Y (e.g., nominalized verb), we infer the base X’s verbal properties (e.g., action predication).

Formally:

- If Y (derived verb, e.g., “booking”) exists, then Y reverse-entails X (base) as verbal (e.g., “book” predicates action).
- This bidirectional reasoning reveals flexibility: the derived form “folds back” to confirm X’s verbal status in non-derived contexts.

In DM, roots ($\sqrt{X}$) are neutral, gaining verbal status via heads (v for verb); reverse entailment infers through derivations. In Construction Grammar, constructions (e.g., [to V Adv]) assign verbal status, with reverse entailment confirming for the base.

2.2 The Reverse Entailment Diagnostic (RED)

RED for verbs tests if an entity acts as a syntactical verb entity:

1. Apply a verb derivation (e.g., nominalization -ing, possessive -’s/of).
2. If the form is grammatical or interpretable, reverse-entail to the base’s verbal status.
3. Test in verbal roles (e.g., predicate, argument assignment) to confirm.

RED proves verbal flexibility for non-verbal bases, emphasizing roles.

3. Examples of Verbal Reverse Entailment and RED

3.1 Book (Verb Base)

Base: “Book” (verb, meaning to reserve).

- Derived: Nominalized “booking” (e.g., “Booking is easy”); possessive “booking’s” (e.g., “Booking’s cost is high”).
- Reverse Entailment: “Booking” entails “book” denotes an action (verbal property); “booking’s” entails possession of verbal aspects. This folds back to “book” in infinitive roles (e.g., “to book a flight”).
- RED Test: In “To book is my priority,” “book” is predicate (verbal). Derived “bookingly” (rare adverb of verb) confirms verbal status, reverse-entailing “book” as a syntactical verb entity.

3.2 To Book Carefully (Infinitive Phrase)

Base: “To book carefully” (verbal phrase).

- Derived: Nominalized “booking carefully” (e.g., “Booking carefully is wise”); possessive “to book carefully’s” (e.g., “To book carefully’s advantage is clear”).
- Reverse Entailment: “To book carefully’s” entails the phrase denotes an action capable of possession (verbal property in nominal form), folding back to confirm its verbal status (e.g., as predicate in “I need to book carefully”).

- RED Test: In “To book carefully is my priority,” the phrase is subject (nominalized verb). Derived “careful booking” confirms verbal status, reverse-entailing “to book carefully” as a syntactical verb entity.

3.3 Run (Verb Base)

Base: “Run” (verb, meaning to move swiftly).

- Derived: Nominalized “running” (e.g., “Running is healthy”); possessive “running’s” (e.g., “Running’s benefits are many”).
- Reverse Entailment: “Running’s” entails “run” denotes an action capable of possession; “running” entails predication. This folds back to “run” in imperative roles (e.g., “Run quickly”).
- RED Test: In “To run is fun,” “run” is predicate (verbal). Derived “runnily” (rare adverb of verb) confirms verbal status, reverse-entailing “run” as a syntactical verb entity.

4. Implications

RED for verbs reveals dynamic branching, supporting models like DM (roots + heads) and Construction Grammar (role-driven constructions). For “book” as base, reverse entailment from “booking” shows verbal flexibility. This has applications in NLP for disambiguation and cognitive linguistics for thinking modes.

5. Conclusion

Verbal reverse entailment and RED formalize category flexibility, proving entities like “to book

carefully” are syntactical verb entities via derivations. This bidirectional approach is a creative contribution, bridging semantics and syntax for dynamic linguistics. Future work could apply RED to other categories or formalize it computationally.

Reverse Entailment Applying RED to All Parts of Speech

The Reverse Entailment Diagnostic (RED), as formalized in our discussions, is a tool to test if an entity acts as a syntactical entity in a category by applying derivations and reverse-entailing back to the base’s status. Your request to apply RED to all parts of speech to prove they “go back to nominal forms” (i.e., can be nominalized or act as noun-like entities through reverse entailment) is insightful, as it highlights linguistic flexibility. In dynamic models like Distributed Morphology (DM), parts of speech are not rigid; roots can merge with nominal heads (n) to become noun-like, and reverse entailment from derived forms (e.g., possessives) confirms this nominal potential. Below, I apply RED to major parts of speech (nouns, verbs, adjectives, adverbs, pronouns, prepositions, conjunctions, interjections, articles), showing examples of reverse entailment via possessives (a noun property), proving they can act as syntactical noun entities and “go back to nominal forms” (nominalization).

- **Nouns (e.g., “book”)**: Derived: “Book’s” (possessive). Reverse Entailment: “Book’s” entails “book” denotes an entity capable of possession, folding back to confirm nominal form in subject roles (e.g., “Book is my priority”).
- **Verbs (e.g., “run”)**: Derived: “Running’s” (nominalized possessive). Reverse Entailment: “Running’s” entails “run” denotes an action as entity, folding back to nominal form (e.g., “Run is my priority” as nominalized verb).
- **Adjectives (e.g., “beautiful”)**: Derived: “Beautiful’s” (possessive, e.g., “The beautiful’s

appeal”). Reverse Entailment: “Beautiful’s” entails “beautiful” denotes a quality as entity, folding back to nominal form (e.g., “Beautiful is fleeting” as nominalized adjective).

- **Adverbs (e.g., “tomorrow”)**: Derived: “Tomorrow’s” (possessive). Reverse Entailment: “Tomorrow’s” entails “tomorrow” denotes time as entity, folding back to nominal form (e.g., “Tomorrow is another day” as nominalized adverb).
- **Pronouns (e.g., “her”)**: Derived: “Her’s” (possessive, e.g., “Her’s is mine”). Reverse Entailment: “Her’s” entails “her” denotes a referent as entity, folding back to nominal form (e.g., “Her is the one” in poetic use).
- **Prepositions (e.g., “after”)**: Derived: “After’s” (possessive, e.g., “The after’s consequences”). Reverse Entailment: “After’s” entails “after” denotes relation as entity, folding back to nominal form (e.g., “After is uncertain” as nominalized preposition).
- **Conjunctions (e.g., “and”)**: Derived: “And’s” (possessive, e.g., “The and’s role is connection,” rare). Reverse Entailment: “And’s” entails “and” denotes conjunction as entity, folding back to nominal form (e.g., “And is a connector” as nominalized conjunction).
- **Interjections (e.g., “oh”)**: Derived: “Oh’s” (possessive, e.g., “The oh’s surprise,” rare). Reverse Entailment: “Oh’s” entails “oh” denotes exclamation as entity, folding back to nominal form (e.g., “Oh is an exclamation” as nominalized interjection).
- **Articles (e.g., “the”)**: Derived: “The’s” (possessive, e.g., “The the’s use is definite,” marginal). Reverse Entailment: “The’s” entails “the” denotes definiteness as entity, folding back to nominal form (e.g., “The is a determiner” as nominalized article).

RED proves all parts of speech can nominalize (act as noun entities), going back to nominal forms via reverse entailment from possessives, as they entail the base denotes an entity. This supports your dynamic view of “book” and phrases like “to book carefully.”

Reverse Entailment in Parts of Speech

Categorization: A Diagnostic for Syntactical Noun

Entities

Author: MAKES PANNER

Affiliation: Independent Researcher

Date: September 28, 2025

Abstract: This position paper generalizes the concept of reverse entailment across all parts of speech, proposing a bidirectional inference mechanism that formalizes how derived forms (e.g., possessives, nominalized derivatives) entail backward to confirm the base form's nominal potential. I introduce the **Reverse Entailment Diagnostic (RED)** as a tool to prove that all parts of speech can be applied reverse entailment and go back to nominal forms, acting as "syntactical noun entities" in dynamic contexts. Using examples like "square/quadrilateral," "to book carefully," and "her house," I demonstrate how RED reveals category flexibility for all parts of speech, challenging rigid lexicalist frameworks and supporting usage-based models. This has implications for syntax, semantics, and cognitive linguistics, emphasizing role-driven categorization.

Keywords: reverse entailment, nominalization, syntactic categorization, dynamic linguistics, parts of speech

1. Introduction

Categorization of parts of speech has traditionally been lexicon-driven, with distinct roles for nouns, verbs, adjectives, etc. (Chomsky, 1970). However, dynamic approaches like Distributed Morphology (DM; Halle & Marantz, 1993) and Construction Grammar (Goldberg, 1995) suggest categories are flexible, often converging on nominal forms through nominalization. This paper formalizes **reverse entailment** across all parts of speech, a bidirectional mechanism where derived forms imply the base's nominal potential.

I introduce the **Reverse Entailment Diagnostic (RED)** to test if all parts of speech can be

applied reverse entailment and go back to nominal forms, acting as “syntactical noun entities.” RED supports non-lexicalist models, showing categories are holistic.

The paper proceeds: Section 2 defines reverse entailment and RED; Section 3 provides examples; Section 4 discusses implications; Section 5 concludes.

2. Reverse Entailment and the Reverse Entailment Diagnostic (RED)

2.1 Reverse Entailment

Standard entailment is unidirectional (e.g., “books” entails “book”). Reverse entailment reverses this: from a derived form Y (e.g., possessive), we infer the base X’s nominal potential, going back to nominal forms.

Formally:

- If Y (derived, e.g., “book’s”) exists, then Y reverse-entails X (base) as nominal (e.g., “book” denotes an entity).
- This bidirectional reasoning reveals flexibility: the derived form “folds back” to confirm X’s nominal status in non-derived contexts.

In DM, roots ($\sqrt{X}$) are neutral, gaining nominal status via heads (n); reverse entailment infers through derivations. In Construction Grammar, constructions (e.g., [NP’s N]) assign nominal status, with reverse entailment confirming for the base.

2.2 The Reverse Entailment Diagnostic (RED)

RED tests if an entity acts as a syntactical noun entity:

1. Apply a derivation (e.g., possessive -'s/of, nominalization -ing).
2. If the form is grammatical or interpretable, reverse-entail to the base's nominal status.
3. Test in nominal roles (e.g., subject, object) to confirm.

RED proves nominal flexibility for all parts of speech, emphasizing roles.

3. Examples of Reverse Entailment and RED

3.1 Square/Quadrilateral (Noun/Adjective)

Base: "Square" (noun/adjective).

- Derived: Possessive "square's" (e.g., "Square's sides are equal").
- Reverse Entailment: "Square's" entails "square" denotes an entity capable of possession, folding back to nominal form (e.g., "Square is a quadrilateral" as subject).
- RED Test: In "Square is a quadrilateral," "square" is subject (nominal). Applied to adjective: Derived "squarer" confirms adjectival, reverse-entailing to nominal base.

3.2 To Book Carefully (Infinitive Phrase/Verb)

Base: “To book carefully” (verbal phrase).

- Derived: Possessive “to book carefully’s” (e.g., “To book carefully’s advantage is clear”).
- Reverse Entailment: “To book carefully’s” entails the phrase denotes an entity, folding back to nominal form (e.g., “To book carefully is my priority” as subject).
- RED Test: In “My job is to book carefully,” the phrase is object (nominal). Applied to verb: Derived “booking” confirms verbal, reverse-entailing to nominal base.

3.3 Her House (Pronoun + Noun)

Base: “Her house” (nominal phrase).

- Derived: Possessive “her house’s” (e.g., “Her house’s roof is leaking”).
- Reverse Entailment: “Her house’s” entails “her house” denotes an entity, folding back to nominal form (e.g., “Her house is beautiful” as subject).
- RED Test: In “Her house is my priority,” “her house” is subject (nominal). Applied to pronoun: Derived “her’s” (marginal) confirms pronominal, reverse-entailing to nominal base.

4. Implications

RED shows all parts of speech go back to nominal forms via reverse entailment (e.g., verbs/adverbs nominalized, adjectives/pronouns possessivized), supporting models like DM (roots + heads) and Construction Grammar (role-driven constructions). For “book” as base, RED confirms nominal flexibility. This has applications in NLP for disambiguation and cognitive linguistics for thinking modes.

5. Conclusion

Reverse entailment and RED formalize category flexibility, proving all parts of speech can go back to nominal forms as syntactical noun entities via derivations. This bidirectional approach is a creative contribution, bridging semantics and syntax for dynamic linguistics. Future work could apply RED to cross-linguistic data or formalize it computationally.
