

THE STRUCTURE OF WORDS IN MEDICAL TERMINOLOGY

Tashkent Medical Academy
Department of Uzbek and Foreign Languages
Lecturer
Achilov Muzaffar Norquliyevich

Annotation. In this article, we have briefly studied how the word structure is used in medical terminology. Word composition - morphology is the study of medical words and their abbreviated or open variants. It is an important task to explain the main part of the word, advantages, spelling rules, spelling rules, and use them in their place. Linguistic studies have been conducted to study and explain its rules.

Key words: morphology, lexicology, semantics, spelling.

Introduction

The structure of words is a branch of morphology that studies medical words and their abbreviated or full forms. Explaining the main part of a word, its advantages, spelling rules, and orthographic rules, as well as using them correctly, is an important task. Linguistic research aimed at studying and explaining these rules is of significant importance in medical terminology as well. These studies allow us to identify how a word changes in the Uzbek language and other languages, its spelling under control, its advantages, and its structural components.

The main objectives of word structure research are as follows: Medical words and their variants: It studies the different variants that a medical word can have. For example, it explains the connection of a word with lowercase letters, uppercase letters, or abbreviations.

The main part of the word: Research helps in identifying the main components of medical words. This is crucial for explaining and understanding the meaning of a word.

The advantages of the word: Structural research helps in studying the advantages of medical words (such as plural, singular, dual, etc.). This is important for accurately and fully explaining medical information and enables the study of its usage in practice.

The rules of spelling: The rules of spelling help in studying how a word should be written in Uzbek and other languages. This is very important for medical professionals, students, and writers of medical-related articles, as they use it to express their information correctly and clearly.

Word structure research helps in fully and accurately explaining medical words and plays a crucial role in solving linguistic problems in medical terminology. This method aids in using medical words correctly and accurately, utilizing medical information in other fields, and ensuring proper communication between medical professionals.

Lexicology and Semantics: It involves the study of the interrelation of medical terms, their synonyms, antonyms, and the differences in their meanings.

Lexicology and Semantics in Medical Terminology: Lexicology is the scientific field that deals with the words of a language, word combinations, their meanings, explanations, and other characteristics. In medical terminology, lexicology studies words and their meanings, how they are assimilated into the language, and their relationship with other languages.

Words and their meanings: Lexicological research on medical words, their explanations, and meanings helps in explaining medical terms, as well as in the processes of their translation and assimilation in medical terminology. The explanations of medical words, the identification of their primary and additional meanings, and the lexicological studies on explaining and interpreting them are important in connecting medical concepts through words in medical terminology and fully explaining them. Words and their meanings, and the differences in their meanings, are a field of study that explores the relationships between people and the areas where they are used. In medical terminology, semantics involves research on the differences in the meanings of medical words, their assimilation, and their

usage.

Contextual semantics: The meaning of medical words, their areas of application, and the differences in their conceptual meanings, which are dependent on the context, are semantic studies that help in fully and accurately explaining articles and conveying language. It is crucial for a better understanding and clearer study of medical words and their meanings in medical terminology. These studies are applied in precise and complete explanations, translation, assimilation, and other important processes in the use of medical words.
