ABSTRACT

The present study examines the syntactic phenomenon of left branch adjective extraction in Slavic languages by investigating two competing views concerning the structure of Slavic noun phrases: the view that Slavic languages without articles project a determiner phrase (DP) that provides a syntactic position for articles, and the view that such extraction is possible because these languages do not project DP. A series of pilot questionnaires were developed using three article-less Slavic languages (Bosnian-Croatian-Serbian, Russian, and Czech) to identify whether a pragmatic context related to focus movement could be responsible for motivating extraction. A "Split DP" theory of complex nominal structure is used to evaluate both the responses to the questionnaires and to suggest a structure that is suitable for accommodating the phenomenon of left branch extraction (LBE) in Slavic. In contrast to the claims made by the no-DP view for Slavic, the results from the questionnaires do not support uniform acceptance of sentences with LBE'd adjectives under conditions of focus movement. The attempt to discover the pragmatic contexts for extraction, however, does offer insights into some of the weaknesses in the current, prevailing no-DP view of LBE while also suggesting the usefulness of a complex DP structure for analyzing this phenomenon in Slavic as well as a possible role for emotivity as part of the context for LBE.

CHAPTER I

INTRODUCTION

Unlike many European languages, including English, most modern Slavic languages do not have articles. As a result, the syntax of Slavic nominal structures is considered, by some scholars, to differ in some basic ways from languages that have articles (Zlatić 1997, Bošković 2005, 2016, Despić 2011). Theories concerning Slavic nominal structure have largely focused on whether the position articles occupy is or is not a universal position. Is it a position available underlyingly in all languages or is it parameterized, dependent on other features and variable by language? The question is not settled. On the one hand there is the claim that there exists a universal structural position for articles that Slavic just doesn't use (Bailyn 2012, Pereltsvaig 2007, 2013) and on the other hand that no such position exists for Slavic; that is Slavic has a different nominal structure (Zlatić 1997, Bošković 2005). The basic premises behind this question are examined in the present study. To that end the nature of nominal structure and current theories of modifier movement within nominal structure are examined. The specific features of Slavic nominals and how comparable they are among contemporary Slavic languages as well as the specific semantics of Slavic nominal modifiers are established for comparison. And finally, the pragmatic and discourse effects that are likely implicated in the syntactic behavior of Slavic modifiers are reviewed. All of these aspects of the question of Slavic nominal structure come into play when investigating whether or not that structure involves a position for articles.

When languages that are known have a structural position for articles but don't use it, as with English plurals, the assumption is that that position is occupied by a null or

covert element representing the missing article. The primary evidence for not having such a position for Slavic is that if the position were there and it were regularly occupied by a covert element, that element would serve to block the movement of modifiers out of the nominal phrase. Modifier movement out of the nominal phrase is a process specifically identified in article-less Slavic languages such as Russian, Czech and Serbian and therefore, assuming a covert article for Slavic is problematic. The current study, therefore, addresses theories of nominal structure that are specifically concerned with the movement behavior of prenominal modifiers. In order to identify the nature of this modifier extraction more precisely, native speakers were asked about these forms. These queries led to the interesting discovery that, without a discourse context, many speakers rejected the forms with extracted modifiers.

As a result of not being able to easily confirm the acceptability of extracted forms, this research attempts to uncover the semantic and discourse contexts for modifier extraction. The expectation is that by better defining the context for extraction, Slavic nominal structure overall may be further illuminated. To this end, an overview of generative syntax in general and a survey of Slavic nominal structure specifically is provided as an introduction to the present research. Chapter II then provides a detailed discussion of the current, competing theories concerning the structure of Slavic nominal syntax. A discussion of scholarship on focus movement is also provided because it is the mechanism identified in the literature as motivating modifier extraction. This background provides the basis for the methodology used to develop the series of questionnaires described in Chapter III. The responses to the questionnaires are discussed in Chapter IV. The results from the questionnaires are then analyzed in Chapter V in terms of both

current theories of nominal structure and theories of focus movement which are introduced in Chapter II. Finally, Chapter VI summarizes the findings from the present study and makes suggestions for further research.

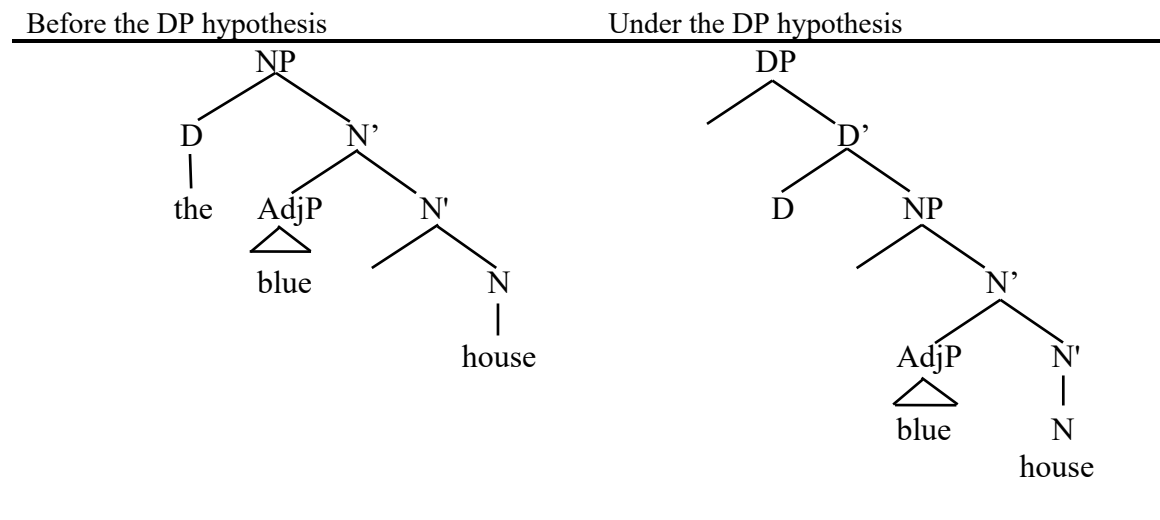

1.1 Nominal Structure in Generative Syntax

In generative syntax, all human language is conceived of as an ordered system with a shared, universal structure. This structure is represented, underlyingly by what is called a Logical Form (LF). In the Minimalist Program (Chomsky 1995), the units that comprise LFs follow rules of movement (Move) and merging (Merge) to produce surface phrasal structures (phonetic form or PF); the actual sentences people produce when they speak. This means that, at base, all human languages share a structure from which all the variations of different human languages can be derived. This structure can be thought of in terms of hierarchical, branching structures. Such structure can be represented cartographically by nodes and branches, where the topmost nodes exist spatially on a left-sided edge of the trees (Rizzi 1997, Cinque 1999, Tsai 2015). This underlying structure involves constituents that comprise nominal structures and constituents that comprise verbal structures, and their combinatorial patterns follow logical principles that are basic to all human language.

Currently, X-bar Theory (Chomsky 1970, Jackendoff 1977) describes the structure as being composed of heads (X), their intermediary connection or adjunction sites (X') and their phrasal projections (XP). Phrases whose heads play purely grammatical rather than lexical roles in the structure are known as functional heads and thus they project functional phrases (FPs). Phrases that primarily convey lexical meaning are lexical heads and they can be verb phrases (VPs), noun phrases (NPs), adjective

phrases (AdjPs), and Adverb Phrases (AdvPs). Within this type of structure, Abney (1987) proposed the existence of a functional phrase known as a Determiner Phrase (DP) which he located hierarchically above and inclusive of NPs. For a DP, the D head selects an NP as its complement (both the D and the NP appear as sisters under a D' node). In article-possessing languages like English, a DP projection provides a natural spot for articles, demonstratives, and possessive determiners. Prior to the postulation of DP, determiners were thought to occupy the specifier position (Spec) of an NP. Proposing the existence of DP addressed the problem of the lone D in a Spec position with no maximal phrasal (DP) projection, a condition that violated the principle in X-bar theory that all heads (including D) should necessarily project phrases.

Figure 1.1. Nominal structure under X-bar theory

In addition to its role hosting determiners, the D head has been identified as the functional locus for referential and definite meaning whether or not the position is realized lexically by a determiner (Longobardi 1994).

1.2 Nominal Structure in Slavic Languages

Historically, Slavic represented a more or less unified language at least through the 9th century BCE.¹ However, with migration and the creation of separate political states, distinct languages began to arise by the 11th century (Schenker 1995). This relatively recent divergence has meant that similar grammars continue to be shared among the various contemporary Slavic languages. Grammatical similarity accounts for these languages' often being treated as a unit in terms of some of their shared syntactic features, such as similar nominal case systems or the absence of articles. Currently, Slavic languages can be roughly divided into three major groupings: (a) East Slavic: Russian, Belarusian, Ukrainian; (b) West Slavic: Czech, Slovak, Polish; and (c) South Slavic: Bosnian/Croatian/Serbian (BCS), Slovenian, Bulgarian, and Macedonian. Within each area there are many dialectal and geographic features that account for a great deal of variation, but East, West, and South represent the major linguistic divisions. Among these, only Bulgarian and Macedonian have article systems. The articles in these languages are comprised of post-positional clitics (or affixes) that appear either on nouns or on modifying adjectives or pronouns and are historically related to demonstrative pronouns (Stojković 2019).

(1) Bulgarian definite articles

- | | | |
|----|------------|-----|
| a. | pūt-jat | (M) |
| | road-the | |
| | ‘the road’ | |

¹ There is a great deal of terminological variation in how a common Slavic language is labeled. It is sometimes called Proto-Slavic and sometimes Slavonic, I am using a more generic term here to represent a unified, mutually comprehensible language that served as the ancestral source of modern Slavic languages (Schenker 1995).

- b. po pŭt-ja
on road-the
'on the road'
- c. kŭšta-ta (F)
house-the
'the house'
- d. moja-ta kŭšta
my-the house
'my house'
- e. dŭrvo-to (N)
tree-the
'the tree'
- f. visoko-to dŭrvo
tall-the tree
'the tall tree'

(2) Macedonian definite articles

- a. pat-ot (M)
road-the
'the road'
- b. po pat-ot
on road-the
'on the road'
- c. kuća-ta (F)
house-the
'the house'
- d. moja-ta kuća
my-the house
'my house'
- e. drvo-to (N)
tree-the
'the tree'
- f. visoko-to drvo
tall-the tree
'the tall tree'

As a group, those Slavic languages without articles all feature developed nominal case systems and relatively free constituent orders. In contrast, Macedonian and Bulgarian only show case on pronouns and have strict constituent orders. In order to give as broad a comparative perspective as possible for Slavic, the current study will focus on Czech to represent West Slavic; Russian to represent East Slavic; and BCS to represent

South Slavic. In addition, Bulgarian is used as a control case for nominal structure in a Slavic language with articles.

The contemporary Slavic languages in the present study all show adjectival morphology for demonstratives, quantifiers, and some possessive pronouns and possessive adjectives. Historically, common Slavic made a distinction between short form adjectives and long form adjectives (Pereltsvaig 2007). Short form adjectives were comprised of the adjectival root morpheme and the gender and declensional endings. Long form adjectives included an infix signaling definiteness that sat between the root morpheme and the gender and declensional endings. Most contemporary Slavic languages retain some morphological or declensional distinctions descended from short and long form adjectives.

Contemporary Russian has generalized long-form adjectives for all adjectives regardless of definite interpretation, keeping a separate declension for them. Russian still uses the short forms for some attributives as well as for adverbs and participles, in such cases they do not have full declensions. Similarly, demonstratives, possessive pronouns, possessive adjectives and quantifiers in Russian follow versions of the common Slavic, short-form declensional systems. Contemporary Czech keeps the distinction between common Slavic long and short forms in the phonology, where adjectives use what is called the “long vowel paradigm”, but quantifiers, possessive adjectives, possessive pronouns, and demonstratives use a non-productive declension distinct from that of most adjectives (Veselovská 2014). Both Russian and Czech possessive adjectives must be derived from animate nouns and both signal definiteness. In both languages such

possessive adjectives are created with “short form” adjectival morphology with limited declensions compared to standard, 'long' form adjectives in both languages.

Table 1.1 Czech Short and Long Form Possessive Pronouns (from Wikipedia)

Case	Possessive Pronouns	
Nom	Masc/fem/neut	Masc/fem/neut
1st sg	Můj/moje/moje	moji/moje/moje
2nd sg	Tvůj/tvoje/tvoje	tvoji/tvoje/tvoje
3rd sg	jeho/její	její
1st pl	Náš	naši/naše
2nd pl	Váš	vaši/vaše
3rd pl	Její	jejich

For BCS, the historical distinction is less apparent. Adjectives, demonstratives, possessives, and quantifiers all share the same adjectival morphology to some degree. One place the distinction between the historical long and short forms still exists in BCS is with the *-i* forms for masculine adjectives which are used only when they are interpreted as definites. When BCS *-i* forms appear along with demonstratives or possessives, they must always follow the demonstratives and possessives in neutral word order (Caruso 2012). As in Russian and Czech, in BCS, if a noun is “adjectivized” to create a possessive, it can only be created from an animate, singular noun and must be interpreted as definite, as shown in (3) (Leko 1999, Caruso 2012).

- (3) a. studentova kniha
 student.F.POSS book.F
 'the student's book'
- b. bratov kofer
 'brother.M.POSS suitcase.M
 'the brother's suitcase'

While there are similarities among these languages, there are also clear differences in terms of how productive the declensional morphologies are for adjectives,

demonstratives, possessive pronouns, and quantifiers across the three languages.

Therefore, it is not accurate to treat all nominal modifiers in Slavic languages with any type of adjectival morphology as equivalent for the purposes of syntax as will be discussed further below.

1.3 Nominal Declensions in Slavic

Nominal declensions in Slavic do differ by language, both in terms of their semantics and their productive morphology. In the literature on the presence or absence of DP for Slavic (Bošković 2005, Rappaport 2000), generalizations are often made based on syntactic similarities among Slavic languages by extrapolating the syntactic behavior of nominals from one article-less Slavic language (BCS and Polish for these authors) to all article-less Slavic languages. This tendency is also generalized in work like that of Bošković (2005, 2016) where the similarity of adjectival morphology across several lexical categories (adjectives, demonstratives, possessives) is reduced to identifying all lexical items in all article-less Slavic languages which have adjectival morphology as syntactic adjectives. However, as mentioned above, even among Slavic languages with morphologically adjectival forms for their demonstratives and possessives, the declensions across those languages for adjectives, demonstratives, and possessives are not necessarily syntactically comparable.

Among the three article-less Slavic languages studied here, the complexity of contemporary adjectival declensional systems varies quite a bit, with Czech and BCS showing a smaller inventory of case forms than Russian. In general, Czech and BCS declensions are coalescing whereas Russian ones have remained relatively distinct. Czech nominal declensions in the singular show a distinction between masculine animate

nominative and accusative, but accusative and genitive forms and dative and locative forms have coalesced, with instrumental forms still distinct.

In BCS nominal declensions in the singular, dative and locative have likewise coalesced. For Czech and Russian there are fewer forms in the plural declensions with only the nominative and genitive distinct by gender but BCS maintains gender distinctions for all plurals (feminine, masculine, and plural). Russian nominals in the singular, on the other hand, demonstrate distinctive declensions for all cases in the singular and the plural for masculines. In terms of argument nominals, all three languages make clear morphological distinctions in the case endings between subjects and objects for all *a*-stem feminine nouns and for all animate nouns (inanimate masculine and neuter accusatives are indistinguishable from their nominative forms).

Table 1.2 Masculine Singular Noun Declensions *oak*

Case	CZECH	BCS	RUSSIAN
Nom	dub	hrast	dub
Genitive	dubu	hrasta	duba
Dative	dubu	hrastu	dubu
Accusative	dub	hrast	dub
Locative	dubu	hrastu	dube
Instrumental	dubem	hrastom	dubom

Tables H.1 – H.4 in Appendix H show the similarities in the nominal paradigms across the languages, while also showing how Russian adjectives and possessive pronouns differ. First- and second-person possessive pronouns for all three languages have full conjugations, but they differ for third person singular and plural possessive pronouns. For example, first person possessive pronouns modifying masculine nouns show full adjectival declensions:

Table 1.3 1st Singular Masculine Possessive Pronoun Declensions in Slavic

	NOM	GEN	DAT	ACC	LOC	INST
CZECH	můj	mého	memu	můj/mého	mém	mým
RUSSIAN	moj	moego	moemu	moj/moego	moem	moim
BSC	moj	mojeg	mojem	moj/mojeg	mojem	moim

But the third person singular masculine possessive ‘his’ when modifying a masculine noun in Czech and Russian are indeclinable forms whereas in BCS it shows a full paradigm:

Table 1.4 3rd Singular Masculine Possessive Pronoun Declensions in Slavic

	NOM	GEN	DAT	ACC	LOC	INST
CZECH	její	její	její	její	její	její
RUSSIAN	ego	ego	ego	ego	ego	ego
BSC	njegov	njegovog	njegovom	njegov	njegovom	njegovim

In the case of possessive adjectives, the generalized morphology in BCS is more clearly not followed in Czech and Russian, where the syntax of demonstratives and possessives are more obviously distinct from that of adjectives overall. Possessive adjectives in Russian are typically divided into two kinds: possessive and relative-possessive. The former uses short-form morphology and has a definite meaning, whereas the latter are more properly attributive. Pereltsvaig (2007:80) points out that prenominal possessive modifiers (4a) can be referential in a way relative-possessive modifiers (4b) cannot be. In the following examples, the expression in (4a) refers to a referent who is a neighbor, whereas (4b) can only refer to a trait typical of neighbors in general:

- (4) a. sosedkino postojanno vyraženie
 neighbor.N.SG.NOM.POSS constant.N.SG.NOM expression.N.SG.NOM
 nedovol'stva

- displeasure.M.SG.GEN
 ‘the neighbor’s constant expression of displeasure’
- b. sosedskoe postojanno vyraženie
 neighbor.N.SG.NOM constant.N.SG.NOM expression.N.SG.NOM
 nedovol’sstva
 displeasure.M.SG.GEN
 Intended: ‘a constant expressing of displeasure, characteristic of neighbors’

Veselovská (2014) notes a similar distinction in Czech by showing that the one type of possessive (5a) (the type showing short-form adjectival morphology), can bind a pronoun, whereas the other (5b) (the type showing productive, attributive adjectival morphology), cannot. For the following data, the subscripts indicate co-indexing and co-reference:

- (5) a. učitelovo_i věčné mluvení o sobě_{i/*j}
 teacher.N.SG.NOM.POSS eternal. N.SG.NOM talking. N.SG.NOM about himself
 ‘the teacher’s permanent talking about himself’
- b. učitelské_i věčné mluvení o sobě_{*i/j}
 teacher.N.SG.NOM.ADJ eternal.N.SG.NOM talking.N.SG.NOM about himself
 Ungrammatical reading: ‘the teacher’s permanent talking about (someone other than) himself’

BCS possessive adjectives also show this same difference in meaning where the possessive morphology signals definiteness (6a) as opposed to the attributive adjectival morphology (6b), which doesn’t require a definite reading and can be paraphrased with a genitive construction (6c) (Progovac 1998).

- (6) a. s tudentov život
 student.M.SG.NOM.POSS life.M.SG.NOM
 ‘the life of the student’
- b. studentski život
 student.M.SG.NOM life.M.SG.NOM
 ‘student life’
- c. život studenata
 life.M.SG.NOM student.M.SG.GEN
 ‘the life of students’

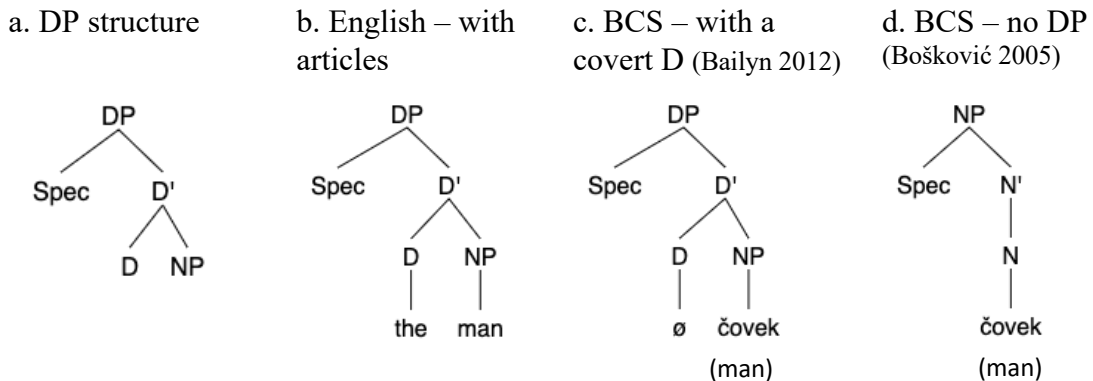

Therefore, if all prenominal modifiers with any adjectival morphology are treated as syntactically equivalent, then the distinction in terms of referentiality between possessive and relative-possessive cannot be made. As we will see in Chapter II, because we are concerned with a syntactic position relevant to definiteness and referentiality (the D head), that lack of distinction may have consequences.

1.4 DP in Slavic

Scholars who posit DP for Slavic Languages (e.g., Bailyn 2012) and those who posit no DP for them (e.g., Bošković 2005) assume different nominal internal syntax.

This difference is briefly shown in tree form below:

Figure 1.2 DP vs. no DP

Slavic languages without a lexical D also tend to have more advanced grammatical case systems as well as allowing modifier extraction. These same features are not found in languages with overt determiners. The presence of an element in D has therefore been identified as the reason for the ban on modifier extraction in languages with determiners. This ban, known as the Left Branch Condition (LBC) (Ross 1987), states that “No leftmost constituent of a larger NP can be reordered out of this NP by a

transformational rule.” It is the LBC that accounts for the ungrammaticality of English phrases like those in (7) (Bošković 2005):

- (7) a. *Whose_i did you see [_{t_i} father]?
 b. *Which_i did you buy [_{t_i} car]?
 c. *Beautiful_i he saw [_{t_i} houses].

Article-less Slavic languages, on the other hand, do allow modifier extraction, which is known as Left Branch Extraction (LBE) in the literature. Bošković (2005) uses the existence of LBE in Slavic languages as evidence against a covert element in D (as in Figure 1.2.(c)) serving to block extraction. According to Bošković, there is no reason to have a D at all because it would only create another node for the extracting modifier to cross, a situation that would violate the Minimal Link Condition (Chomsky 1993, 1995).² To illustrate LBE using BCS data, consider (8). From the standpoint of the no-DP analysis, the BCS expression meaning ‘beautiful houses’ can be broken up as in (8b) with the adjective appearing to move out of the nominal projection to a position before the verb. This is theorized to be possible only when there is no blocking DP layer in BCS (Bošković 2005).

As shown in (8).

- (8) From Bošković 2005:2
- a. On je video [ljepe kuće]

² The Minimal Link Condition in Minimalist syntax states that movement chains should be as short as possible, typically, no more than one position for any given move (Radford 1997:137). See Chomsky (1995) for details.

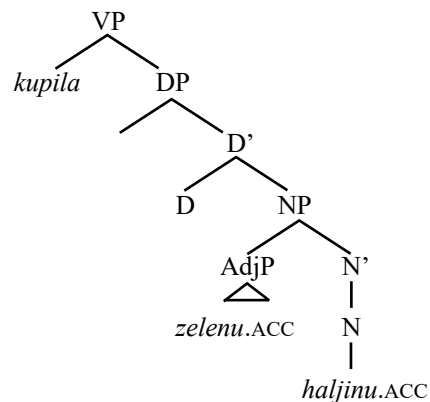

‘He saw BEAUTIFUL houses.’

LBE’d modifiers are always extracted from argument nominals (AP movement) within the VP, which means the NP is typically in a non-nominative case such as accusative or dative. The extracted modifier can therefore be shown to have acquired its case in its base-generated position, and thus its syntactic relation to the head noun (sharing number, gender, and case features) remains evident even when the modifier has been extracted out of the NP and subsequently out of the phrase. The agreement morphology on the extracted modifier at PF shows that in the LF, the modifier adjoins to the NP in a position where the NP has already gained its syntactic role as illustrated in Figure 1.3.

Figure 1.3 Modifier Adjunction

kupila	zelenu	haljinu
bought.F	green.F.ACC	dress.F.ACC

‘She bought a green dress.’

The more developed case systems in languages that allow modifier extraction make the syntactic function of the extracted element unambiguous, because the extracted element's syntactic role is evident by its case ending.

As the initial inquiry to native speakers found that the isolated LBE tokens taken from the literature are not accepted by all speakers, in the following chapters, the acceptability of LBE tokens will be tested in terms of the roles that semantic categorization and pragmatic context may play in defining allowable LBE. It is important, at the same time, to note that the premise that all article-less Slavic languages are directly comparable in terms of both their productive adjectival morphology and in terms of their nominal syntax is over-simplistic at best. This study will show that while there are notable similarities among the Slavic languages investigated, some features of their nominal syntax do not align enough to justify generalizations about modifier extraction for all article-less Slavic languages. The preceding discussion about the differences in Czech, BCS, and Russian adjectives will help provide a foundation for assessing some of the claims made on behalf of no DP hypothesis in the next chapter.

CHAPTER II

LBE, PREVIOUS ANALYSES, AND FOCUS MOVEMENT

As briefly mentioned in Chapter I, there are two primary disciplinary approaches to nominal syntax in Slavic. One is the view held by Bošković (2005, 2012, 2016), who promotes a simple nominal structure with an NP as the maximal projection for nominals. The primary evidence given in support of this structure is the ability of nominal modifiers to extract from their phrase, a situation that is argued to be possible only if the NP is not dominated by a DP. The other view, held by Pereltsvaig (2007, 2013) (as well as authors like Bailyn (2012)), is that Slavic nominals have a DP maximal projection above NP that includes functional projections and that this more complex structure can be used to explain many aspects of Slavic nominal syntax, such as semantic variations related to the ordering of modifiers. Both views have their merits and explanatory strengths; the no DP hypothesis for Slavic provides a persuasive explanatory framework for LBE specifically, whereas the DP hypothesis follows a more generally accepted theoretical framework that postulates DP structure in all human languages. The DP hypothesis, however, does not clearly address the mechanisms of LBE within the Minimalist Program in keeping with the principles of locality restrictions (not violating the Minimal Link Condition) or the Phase Impenetrability Condition (PIC), which requires that the extracted modifier first move to the Spec or head of a phase to be able to extract from the phrase.³ Pereltsvaig

³ The Phase Impenetrability Condition (PIC), states that only elements in the head or Spec of a phase allow for extraction out of the phrase (Chomsky 2001). In the original Minimalist Program (Chomsky 1995), only CPs or vPs are considered phases. A strong phase would be a point in a derivation when features are checked and removed from the phrase leaving the form that ends up being pronounced in the phonetic form

finds LBE unproblematic in a DP framework because unlike Bošković (2005, 2012, 2016), she assumes that only an adjective, rather than an AdjP, undergoes LBE when it can be the center of an intonational contour indicating contrastive focus (Pereltsvaig 2007:81). Nevertheless, Pereltsvaig does not directly address the mechanism involved with LBE in a DP structure. Similarly, even within the comprehensive discussion of the syntactic mechanism at work in LBE by Bošković, he does not directly address what motivates the movement that causes LBE.

As Chomsky (2000) points out, all syntactic movement needs to be motivated. Because LBE is a process by which a modifier not only extracts from its NP but extracts from the TP, the most likely motivation is an operator at the far left of the nominal structure that instigates the movement that LBE represents; first to the edge of the nominal phase and then to the edge of the CP. This “left-periphery” of the phrase is commonly considered a location where discourse-related pressures influence syntax (e.g., Rizzi 1997, Kiss 1998, 2007). Bošković (2005:27), for instance, makes passing reference to LBE as focus movement but does not further investigate its motivation in any depth, and, as mentioned above, Pereltsvaig considers LBE as involving contrastive focus. However, if LBE is focus movement, in order to make sense of the initial rejection of LBE forms by the queried native speakers, then a more nuanced understanding of focus movement as a syntactic process will be helpful. And such understanding would include

(PF) of an utterance. A phrase with a full argument (vP) or a phrase with its propositional content expressed (CP) are the types considered “strong phases” by Chomsky (2001).

an examination of the discourse-syntax interface within which left periphery processes commonly are expressed.

2.1 Evidence of Structure above NP: The DP Hypothesis for Slavic

Bailyn (2012) and others (e.g., Pereltsvaig 2007, Veselovská 2014, Progovac 1998, Leko 1999) assume that there should still be a DP projection in Slavic even with LBE, because there are still elements that appear to occupy functional projections above the NP. For example, as a free word order language, Slavic should allow the recursive adjoining of as many adjectival phrases as needed in whatever order desired. However, Slavic demonstratives, quantificational determiners and possessive determiners, while morphologically similar to adjectives, do not behave like other adjectives in terms of ordering restrictions; they will always occur above attributive adjectives. Notably, however, Pereltsvaig (2007, 2013) maintains that ordering restrictions alone are not the primary reason for postulating DP. In particular, Pereltsvaig (2007) reiterates Longobardi's (1994) observation that DP assigns the features of definiteness and referentiality. She insists that referentiality and definiteness be considered in conjunction with noun modifier ordering restrictions as an argument in favor of an extended nominal structure above the NP.

To account for DP in Slavic, there is the evidence from Polish presented by Rappaport (2000), who tests whether the extraction-blocking function of DP can be supported in cases of complement and adjunct extraction for direct objects. He compares Polish, an article-less, West Slavic language and English, a language which uncontroversially has DP. For all cases, save prenominal modifiers, he finds that Polish patterns like English. All of the following types of direct object modifiers cannot extract

in Polish or in English: post-nominal adjuncts of NP that are PPs (1a), post-nominal bare NP adjuncts of N (1b), post-nominal complements of NPs that are PPs (1c), and post-nominal complements of N that are bare NPs (1d). Rappaport notes that the absence of DP, which is claimed to be the mechanism for allowing prenominal modifiers to extract, should equally allow extraction for these types of post-nominal modifiers, but they are not extractable.

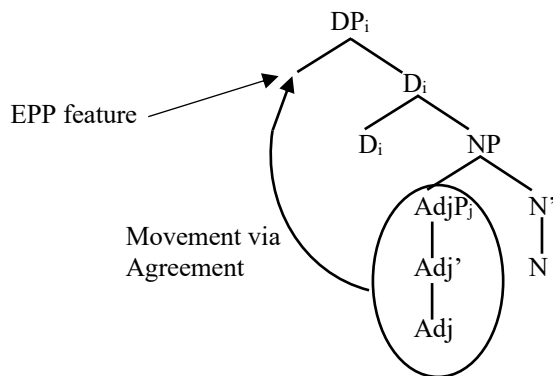

(1) N modifier extraction in Polish (Rappaport 2000).

The Extended Projection Principle (EPP) attracts elements to the top of the nominal structure by requiring that some syntactic element occupy a subject (Specifier) position within a phrase (Chomsky 2001). For Rappaport, instead of there being a null element occupying D in Slavic, there is a parameterized feature that necessarily attracts elements to the DP domain. In these cases, it is not DP that is parameterized but rather the EPP feature of the D head. According to Rappaport, when EPP is operational in a

language without overt articles, an ‘escape hatch’ for the phrasal extraction of elements is created because EPP attracts constituents to [Spec, D] for feature matching and doesn't require a null element to occupy that position. Technically, the process is as follows: the phase edge of vP is the position from which a phrase (like the AdjP in all LBE situations) can extract to the Complement Phrase (CP). The traditional concept of EPP is that it is what brings a sentence subject to [Spec, vP]. Rappaport makes the argument that DP parallels vP in being a phase and thus a position where the PIC will operate, with the EPP checking the nominal agreement features that D governs. The AdjP moves to [Spec, DP], now seen as a phase edge and then extracts to [Spec, vP] and then out to the CP. Rappaport notes that the adjoined AdjP shares agreement features with its NP and therefore also with D, and that, by “transitivity”, it can be susceptible to a [Spec, DP] EPP process (p. 193). Elements attracted to [Spec, DP] are thus able to reach the edge of the phrase and subsequently extract. For example, Rappaport gives the following tree (2000:194).

Figure 2.1 Parameterized EPP as a feature of a D head in Polish

2.1.1 Referentiality and Complex Nominal Structure

Bošković (2005, 2016) sees Slavic nominal structure as fairly simple: an NP and its adjuncts and complements. It is, however, possible to theorize nominal structure as

containing many FPs above the NP but still within a basic [DP[NP]] structure. Many, like Pereltsvaig (2013) note that nominals don't have to project DP, as evidenced by predicative nominals that are demonstrably only NPs (as with predicate nominals). But, following Longobardi (1994), Pereltsvaig treats argumenthood for nominals as necessarily correlated with referentiality and assumes that both referentiality and argumenthood are functions of DP. Therefore, when a nominal phrase acts syntactically as an argument and when its meaning is referential, Pereltsvaig assumes that that nominal phrase must be a DP. It becomes necessary to project DP even for an article-less language like Russian because when elements move above NP, when they move through a position en route to extraction (LBE) or for other functions (approximative inversion), these elements create referential meanings by feature checking above NP.

To provide evidence for the presence of structure above NP, Pereltsvaig (2013:206) identifies the case of “doubly-agreeing nouns” in Russian where a syntactically masculine noun of the type used for professions, when used to refer to a woman, will condition masculine grammatical gender on modifying adjectives, but will often condition feminine grammatical gender on sentential predicates which agree with the subject.

- (2) Example of the disjunction between a Russian masculine subject and feminine past participle:

naš	brigadir	naxodilas'	v	dekretom otpuske
our.M.NOM	foreman.M.NOM	was.F.PST	on	maternity leave

‘Our foreman was on maternity leave.’

(from *Komsomols'kaja Pravda*, 17 February 1962, reproduced in Pereltsvaig 2013:206)

This agreement pattern arises because the noun expresses morphological gender and the adjectival modifier feature checks the NP for agreement, but the referential, semantic gender triggered by Φ -features is located in a functional projection above NP and that is what conditions the predicate agreement. The agreement pattern evident at PF provides evidence for the effects of an FP with referential features.

Also suggestive of an expanded nominal structure is the behavior of numerals in Russian. Numerals are nominal cardinal expressions with distinctive, non-NP syntactic behavior. According to Pereltsvaig, the non-DP view of Slavic holds that numerals are essentially NPs. The syntactic behavior of numerals, however, argues in favor of their being their own functional category, projecting a NumP which is structurally located above the NP, but still nominal. Like nouns, Russian cardinality expressions can have genitive complements (Pereltsvaig 2013:202).

- (3) a. Cardinal numeral with a genitive complement
 pjat' knig
 five.nom books.pl.gen
 'five books'
- b. Noun with a genitive complement
 avtor knig
 an/the author.NOM books.PL.GEN
 'the author of books'

But, unlike nouns, when numerals are not in the nominative or accusative case, their complement noun appears in whatever oblique case the numeral is in.

- (4) a. Cardinal numeral in instrumental case and the noun also in instrumental case
 pjat'u knigami
 five.inst books.pl.inst
 'five books'
- b. Noun in instrumental case with a genitive complement
 avtorom knig

author.INST book.PL.GEN
 ‘author of books’

The contrasting behavior of cardinal numerals compared to cardinal nouns provides further evidence for FPs within the nominal structure but above NP. Cardinal numerals condition neuter, third person agreement on predicates (5a), in which case adjectival agreement will be with the main noun, not the cardinal numeral (5b), and, in East Slavic languages at least (Pereltsvaig 2013), cardinal numerals can invert with their noun to give an approximative meaning (5c). In contrast, predicate and adjectival agreement with cardinal nouns follow the noun itself and approximative inversion is not possible with cardinal nouns. In (6a) and (6b) the cardinal noun ‘desjatok’ is a masculine singular noun which acts as the subject and object of the sentences respectively, and it therefore requires masculine singular agreement on the participle ‘opublikovan’ and the adjective ‘celyj’. In (6c), the cardinal noun ‘desjatok’ cannot invert with the genitive plural noun ‘rjumok’ and therefore cannot be used to express an approximative meaning (Pereltsvaig 2013:203).

- (5) a. Letom opublikovano desjat’ knig
 During summer were published.SG.N ten.NUM book.PL.GEN
 ‘During the summer, ten books were published.’
- b. Marija vypila celyx desjat’ koktejlej
 Maria drank.F.PST whole.PL.GEN ten.NUM cocktails.PL.GEN
 ‘Maria drank a whole ten cocktails.’
- c. Marija vypila rjumok desjat’ vodki
 Maria drank.F.PST glasses.F.PL.GEN ten.NUM vodka.F.GEN
 ‘Maria drank up about ten glasses of vodka.’
- (6) a. Letom opublikovan desjatok knig
 During summer were published.SG.N ten.M book.PL.GEN
- b. Marija vypila celyj desjatok koktejlej
 Maria drank.F.PST whole.M.SG.ACC ten.M cocktails.PL.GEN

- c. *Marija vypila rjumok desjatok vodki
 Maria drank.F.PST glasses.F.PL.GEN ten.M vodka.F.GEN

Again, if NumP occurs above NP, then referentiality is expressed when some linguistic expression occupies the head position of that FP or something has moved there from the N position. That referentiality is evident in the verb/participle agreement. Pereltsvaig also asserts that the appearance of demonstratives and possessives which would typically appear in D in languages like English relative to elements appearing in NumP gives a semantic and syntactic variation that points to the existence of DP. To see this, compare (7) and (8) (Pereltsvaig 2013:206).

- (7) eti pjat' mašin
 these.PL.ACC five.ACC cars.PL.GEN
 'these five cars'
- (8) pjat' etix mašin
 five.NOM/ACC these.PL.GEN cars.PL.GEN
 'five of these cars'

According to Pereltsvaig the definite reading in (7) points to the demonstrative appearing in D, and the general "of a kind" reading for (8) points to the demonstrative appearing below NumP in the Spec of the NP for 'mašin'.

Pereltsvaig (2013) identifies the same process in an alternation of possessives before or after a cardinal expression. Possessives before a cardinal expression signal exhaustivity while possessives appearing after a cardinal expression do not signal exhaustivity. With certain adjectives, when they appear before the cardinal expression, they yield a definite reading (9) and when they appear after a cardinal expression, the nominal they are a part of can have either a definite or an indefinite interpretation (10) (p. 207).

- (9) Diminy pjat' knig
 Dima's.POSS.ACC five.ACC books.PL.GEN
 'Dima's five books'
- (10) pjat' Diminyx knig
 five.ACC Dima's.POSS.GEN books.PL.GEN
 'five books of Dima's'

Given this interpretive pattern Pereltsvaig posits that there is a position above NP at the left periphery of the nominal structure that feature-checks for referentiality and definiteness.

Bošković (2008) rebuts Pereltsvaig by noting that even with NumP, there is no reason to theorize a DP projection in BCS, or other Slavic languages, because it is possible to postulate a NumP as merging with a Quantifier Phrase (QP), which will always be above NP even in the no-DP interpretation. Bošković (2016:10) maintains that ultimately such ordering restrictions are “not syntactic in nature, but semantic/prosodic”. The relative positioning of modifiers for Bošković is a non-issue for syntax, it is an important feature suggesting a more complex nominal structure for Pereltsvaig. For her, these ordering patterns can best be accounted for by assuming an underlying complex nominal structure such as Scott's (2002) with an FP situated above the NP feature-checking for referentiality. This view is opposed to Bošković's recursive adjunctions of morphologically-defined AdjPs with no need to postulate further FPs with specific features.

2.2 Nominal Structure and LBE: The No DP Hypothesis for Slavic

Abney (1987) argues in favor of the existence of a syntactic position above the NP that accounts not only for determiners (Ds) in languages that have them, but also for functional heads that can host elements such as the Saxon (possessive) genitive in

English. This functional projection, the DP, would be inclusive of NP in a cartographic system. Longobardi (1994) theorizes that DPs must not only be a functional projection for arguments but that they are also likely the structural locus of both definiteness and referentiality, with many languages realizing D heads in the form of regular definite and indefinite articles. According to Longobardi, argument nominals always project DP, whereas only non-argument nominals can appear as bare NPs (such as in predicative positions, as vocatives or in exclamations). The assumption has thus been, that because they never lexically realize D, the syntactic structure of article-less languages must instead realize D with a covert element occupying that position.⁴ Corver (1992) notes that because Czech and Polish (and other article-less Slavic languages) allow LBE, the ban on movement expressed by the Left Branch Condition (LBC) is not in operation. It is therefore Corver who first proposed that the LBC correlates with the presence of a structural DP in the syntax and alternatively, the possibility of LBE correlates with the lack of a structural DP in the languages under investigation. This is the starting point for scholars of Slavic languages to propose a parameterized status for DP.

Zlatić (1997), Despić (2011, 2013), and Bošković (2005, 2008, 2009, 2010, 2016) support the no-DP hypothesis for Slavic by highlighting several syntactic features in

⁴ Technically, the Empty Category Principle (ECP) assumes that a null element would necessarily occupy the structural subject position [Spec, DP] if no D is lexically realized. In Government and Binding theory, this is expressed in terms of the government of traces, but under the Minimalist Program it is more generalized in conjunction with the EPP as in Rizzi 2016 where operators that govern theta-role licensing obligatorily attract and “freeze” elements in [Spec, DP].

South Slavic, more specifically Bosnian/Croatian/Serbian (BCS), which they take as evidence for the absence of a DP projection. These features are summarized in (11).

- (11) a. the extraction of adjuncts and prenominal modifiers (LBE),
 b. specific features of BCS *wh*-movement, and
 c. scrambling.

More recently, however, Bošković (2016), noted that whereas *wh*- movement and scrambling may still be accommodated by a nominal structure containing DP, LBE alone is the syntactic feature that points most strongly to a likely absence of DP for article-less Slavic languages.

Bošković's work has extensively developed the no-DP analysis for Slavic languages, using BCS as his main focus and LBE as its primary evidence. That LBE is found in all article-less Slavic languages is his primary evidence for there being no blocking covert D and hence no DP projected above the NP. In Bošković 2005, he offers evidence for an NP over AP structure for Slavic syntax, and the applicability of anti-locality and minimality constraints on phrasal movement to account for what does and doesn't act as a barrier to extraction in the presence or absence of DP. His 2005 article is also where he fully introduces the theory that Slavic NPs are actually phasal in nature, a necessary status for extraction under the PIC. Bošković cites Corver (1990, 1992) as one of the first to note that Ross's LBC doesn't appear to apply to languages like Czech and Polish, which are able to extract modifiers from their NPs. As Chomsky (1986) proposed, minimality barriers should serve to block constituent extraction, thus creating too many (or too few) stopping places for a moved constituent on its way out of the phrase.

Along with discounting a covert D and any barrier D could create, the category of D should be eliminated altogether, according to Bošković, because elements that typically occupy D (e.g., determiners and possessives) are actually adjectives in Slavic, not separate syntactic categories specific to D. As syntactic adjectives, possessives and determiners adjoin to the NP just as adjectives do, rather than occupying a position in a functional projection above the NP. Bošković’s argument in favor of considering possessives, demonstratives, and determiners as adjectives is that: 1) they can be used as predicates, 2) can “stack” with each other (i.e. in BCS, one can say “this my photograph”), 3) can be freely ordered (scrambling),⁵ and 4) most importantly, they exhibit adjectival morphology. As discussed in Chapter I, the morphology of possessive pronouns isn’t as straightforwardly adjectival across Slavic languages as Bošković makes out and is not even uniformly adjectival for BCS.

2.2.1 Semantics of BCS Modifiers

For Bošković’s theory, because all nominal modifiers with adjectival morphology are adjectives, all adjectives have the same “modification semantics” (Bošković 2016:5). He says that even for possessive pronouns or possessives adjectives of the kind formed from proper nouns (e.g. *Jovanov* ‘John’s’) in BCS, the semantic composition can work without DP. Under this analysis, semantic composition will treat all possessives exactly as it would treat any adjective, i.e., as denoting properties of individuals (or of type <et>), and they will be subject to Predicate Modification in the sense of Heim and Kratzer

⁵ But see below for a discussion of the scholarship that supports the view that BCS adjectival ordering is not entirely free.

(1998) when they combine with the NPs they modify (which are also of type $\langle et \rangle$).⁶ On the other hand, Bošković does allow that demonstratives, while also showing adjectival morphology, do not denote something of type $\langle et \rangle$ but rather of type $\langle \langle et \rangle e \rangle$; that is, they combine with something of type $\langle et \rangle$, yielding an individual of type $\langle e \rangle$, analogously to the English definite article *the*. Bošković points out that for definite expressions, adjectives/possessives must compose with the noun first and then compose with demonstratives because when a demonstrative has composed with an individual-denoting expression of type $\langle e \rangle$, it cannot be further modified by predicative expressions of type $\langle et \rangle$. Otherwise, for Bošković, demonstratives may be interpreted as either adjuncts (α Ps) or possibly yet another form of QP which *can* dominate an NP.

Bošković considers prenominal modifiers as always adjoined, therefore he needs to address Chomsky's (1986) injunction against adjunction to arguments. He solves this by claiming that the ban against argument adjunction only applies derivationally, pointing out that feature checking for BCS prenominal modifiers must precede Case checking, making such NPs “non-arguments” at the time of modifier adjunction. He thus asserts that the entire NP only later merges with the verb as an argument; in languages like English, it is always a DP that merges with the verb (Bošković 2005:8). Therefore, at the point where a prenominal modifier extraction occurs (presumably to somewhere above

⁶ In denotational semantics, $\langle e \rangle$ represents a type that denotes individual entities, whereas $\langle t \rangle$ denotes truth values (0 or 1). For a function expressed as $\langle et \rangle$, e is the input and t is the output. Most nouns are of type $\langle et \rangle$ because the noun denotes a characteristic function of a set of individuals. For example, the meaning of the word ‘cat’ is a set of individuals that have the property of being a cat.

the Inflectional Phrase (IP) or CP), the NP is not yet an argument and is therefore amenable to modifier adjunction. Bošković notes that, technically, the V should also project a minimality barrier with its VP and that should affect extraction (Chomsky 2001) but seemingly does not in the case of LBE. To explain this, Bošković notes that while an argument NP is a complement of V (not an adjunct), that NP by itself won't project a minimality barrier for any AdjP trace adjoined to it, because according to him, adjunction to any XP means that X can't act as a barrier (Bošković 2005:7).

2.2.2 LBE and Phases

For LBE to take place, the modifier must first move to a position at the left-most edge (cartographically the “top”) of the phrase before it is able to extract from the phase in accordance with the PIC. According to Bošković (2016), EPP drives the movement of an element to the Spec of the phase. Because head movement needs to be *local*, a head can only move to the “next highest head” crossing only one phrase boundary. A movement of a head to its own Spec does not fulfill the requirement of crossing a phrase boundary (Radford 1997:264). Bošković notes that if a modifier moves through an NP to a DP that is acting as a phase boundary, that would violate the Minimal Link Condition but it would violate antilocality if it moved from the head position to its own Spec. Because the modifier does extract in Slavic, Bošković reasons that either there is no DP, or LBE violates antilocality (by not crossing a full phrasal boundary) or it is violating the PIC by extracting from a Spec that it isn't at a phase edge. Because Chomsky (2001) identifies CPs and vPs as the only phase boundaries, Bošković finds it necessary to extend phase status to NP in Slavic.

To illustrate LBE using BCS data, consider (12) (Bošković 2005:2).

Capitalization here indicates intonational focal stress in English as equivalent to the focalization indicated by the LBE movement in the BCS.⁷

(12) LBE in BCS

- a. On je video [lijepe kuće]
 He AUX saw.M.3SG [beautiful.F.PL.ACC houses.F.PL.ACC]
 ‘He saw beautiful houses.’
- b. [Lijepe]_i je video [t_i kuće]
 [beautiful.F.PL.ACC]_i AUX saw.M.3SG [t_i houses.F.PL.ACC]
 ‘He saw BEAUTIFUL houses.’

From the point of view of the no-DP analysis, “beautiful houses” can be broken up as in (12b) with the adjective appearing to move out of the phrase to a position before the verb. The adjunct *lijepe* moves out of the nominal phrase because it is driven by EPP to the Spec of the NP at the leftmost edge of that nominal phrase. If that phrase is also the edge of a “phase”, the modifier is then in the syntactic position that will allow extraction to CP according to PIC (Bošković 2005:15).

The phase status of NP in Slavic, however, does not guarantee the extractability of prenominal modifiers in Bošković’s (2016) analysis. He notes that the syntactic context within which the adjectives are situated plays an important role in determining the status of the Spec relative to the PIC. He resorts to syntactic context to explain why there are demonstrably cases in BCS where the NP does not allow modifiers to extract

⁷ BCS is a pro-drop language. The absence or presence of the subject pronoun does not affect extractability. Placing the adjective at the beginning of the phrase does however affect the placement of the clitic *je* because BCS does have a phonological requirement that such clitics occur in a “second” position in the phrase (Talić 2019).

such as when there is a demonstrative or another adjective present; at the same time extraction is allowed when the other adjective is a possessive.

Although Bošković asserts that all pre-nominal modifiers with adjectival morphology should be considered adjectives with respect to adjunction and extraction, the differences between possessives, demonstratives, and attributive adjectives as well as differences among attributive adjectives seem to assert themselves all the same. Overall, Bošković (2016) notes that LBE cannot occur if there is more than one adjective modifying the noun except when one of the adjectives is a possessive, or a demonstrative, or in cases of contrastive focus. But even assuming that contrastive focus is the discourse context for those cases where there are multiple modifiers and LBE occurs, there are still restrictions on what can extract. To account for variations in allowable extraction when multiple modifiers are present, Bošković grants that the status of the modifier at the phase edge affects the ordering of the modifiers. Whether a modifier is a demonstrative, a possessive, or even, in some cases, an attributive adjective that “must appear above” another attributive adjective determines what is at the phase edge and therefore what is extractable (p. 12).

According to Bošković (2005, 2016), when there are two attributive adjectives, the topmost one can extract under contrastive focus although he does not define the process that determines a ‘topmost’ adjective within a free word-order language. For instance, he provides the following examples.

- (13) *Mašinskog_i je on otpustio [NP neozbiljnog
 mechanical.M.ACC_i AUX.M.SG he fire.PST [not serious.M.ACC
 [NP t_i [NP inžinjera]]].
 [t_i [engineer.M.ACC]]]

Intended: ‘He fired a mechanical engineer who was not serious.’

(14) ?Neozbiljnog_i je on otpustio [NP t_i [NP mašinskog
not serious.M.ACC_i AUX.M.SG he fire.PST [t_i [mechanical.M.ACC
[NP inženjera]]].
[engineer.M.ACC]]]

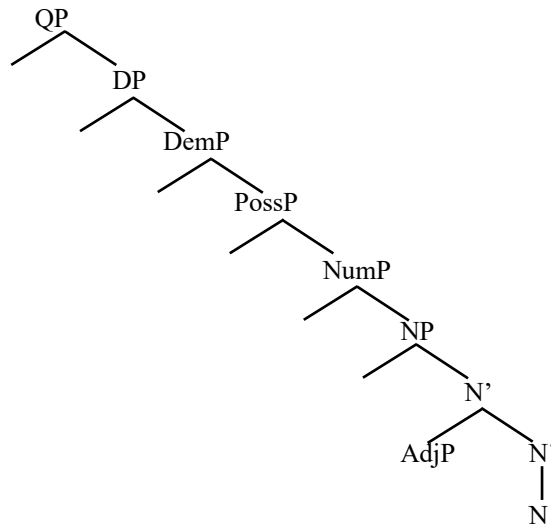

Intended: ‘He fired a mechanical engineer who was not serious.’

(13) is judged ungrammatical because, according to Bošković, ‘mechanical’ has to be below ‘not serious’, but (14) is acceptable (though not perfect) because ‘not serious’, being the structurally higher modifier, is located at the phase edge and is at least possibly extractable (presumably under contrastive focus). He does not explain whether this is true of any adjective combination with ‘mechanical’ or just relative to ‘not serious’. The reason why some adjectives apparently have to adjoin above others is not discussed in Bošković 2016.

2.3 Expanded DP and Adjective Ordering

It is possible to consider nominal structure as much more complex than the structure used in Bošković’s (2005, 2009, 2014, 2016) analysis. In his analysis, an NP may occur within a QP, but at base, his view is that nominal structure is comprised of just the NP and any complements or adjoined modifiers (e.g., AdjPs, PPs). Alternatively, an expanded view of DP allows for more functional structure within the DP by including projections for QPs, Numeral Phrases (NumPs), and Possessive Phrases (PossPs). An expanded structure would be more like the structure in Figure 2.2.

Figure 2.2 Basic expanded DP structure for Slavic (adapted from Leko 1999, Rappaport 2000, and Pereltsvaig 2009).

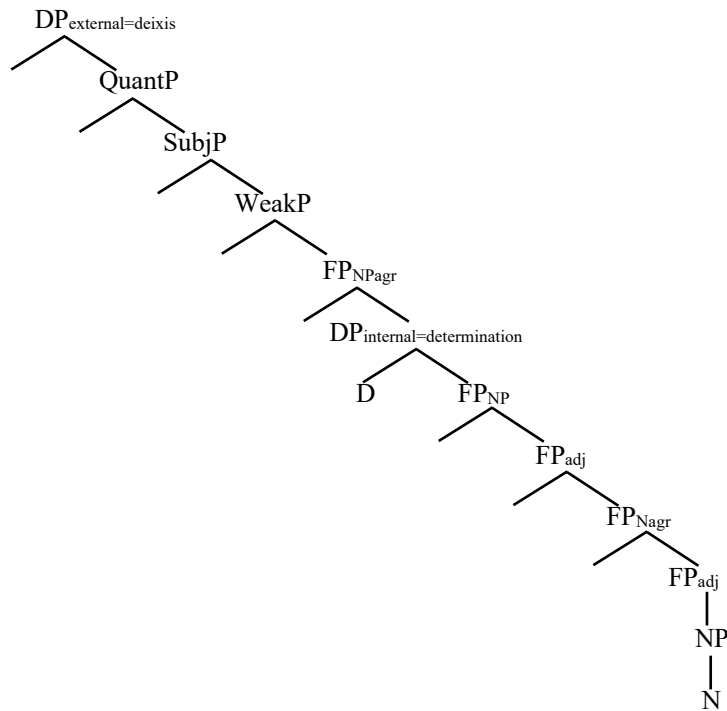

Theories of expanded DP structure have been developed in part to account for the tendency of adjectives to appear in specific orders cross-linguistically in neutral contexts (Laenzlinger 2005, Cinque 2005, Svenonius 2008). Cinque (2005), taking a cartographic view of constituent order variation, shows that when languages exhibit orders different from the one in Figure 2.2, these orders can be accounted for by the movement of the NP leftward in the hierarchy. If the modifiers are base generated as DemP, NumP, or AdjP, then the instances where any of those modifiers appear to the right of NP are due to the NP moving leftward up to the Spec of an Agreement functional projection [Spec, AgrP]. In testing this theory, Cinque hypothesizes that NPs can bring along their adjoined constituents in a process known as “pied-piping”. In this manner, he is able to account for most all attested modifier orders found cross-linguistically. He also finds that NP movement to a higher [Spec, AgrP] without pied-piping is more marked and less attested than those instances where the movement of an XP containing the NP and the pied-piped

constituents. In other words, if a constituent moves, it is most likely to bring all its daughter nodes with it. To trigger the movements, Cinque proposes the need for each projection to be licensed by a nominal feature associated with an FP to which the NP or NP-containing XP moves. He further shows that what attracts a head to a specific Spec of an agreeing FP is an FP that shares features with it. He formulates the requirement as follows (Cinque 2005:326):

- (15) The category closest to H is the category c-commanded by H that is dominated by the fewest number of nodes (where “node” includes every node, whether “category” or “segment,” in Kayne’s (1994) sense.

Laenzlinger (2000) further explicates this expanded DP view by giving names to the likely FPs to which these modifiers would be attracted for licensing. He notes that while DemP and NumP have a fairly fixed licensing, AdjPs comprise a variety of categories which among themselves demonstrate ordering restrictions while still being contained within DP more generally. His first pass at a cartographic representation is shown in Figure 2.3 where, along with QP (here ‘QuantP’), he includes a Subject Phrase, WeakP (which he sees as a position that can pronominalize some adjectives), AgrP (here ‘FP-‘NP_{agr}’) which holds agreement features), and then further FPs with features associated with the N more closely than the maximal DP in the DP internal space (Laenzlinger 2000:61).

Figure 2.3 FPs within DP (from Laenzlinger 2005:78).

In Svenonius' (2008) view, typological data suggest that adopting such a layered DP approach makes the most sense in accounting for adjective ordering. Among attributive adjectives, he identifies those that describe sortal features as merging with an FP called SortP, those that describe countable features with an FP called UnitP, and those that account for plural meanings with an FP which he calls PlP. After making a typological comparison for orderings among DemP, NumP, AdjP, and N, he also compares ordering among languages for articles, plurals and nouns (Art, Pl, and N) across languages. He then combines the two ordered systems and arrives at the following ordering within DP of 'DemP > Art > NumP > PlP > AdjP > N'. Wherever a modifier appears will affect what order other will appear in to express their semantics within the available cartographic hierarchy.

2.3.1 *Adjective Ordering in Slavic*

Even as languages with comparatively free word ordering, article-less Slavic languages do still exhibit the kinds of modifier ordering hierarchies identified by authors like Cinque (2005), Laenzlinger (2005), and Svenonius (2008). Pereltsvaig (2007), for example, examines evidence of adjective ordering in Russian. She applies Scott's (2002) hierarchy for adjectives to Russian nominals using the following ordered categories that he proposes: subjective evaluation (nice/*prijatnyj*) > size (large/*krupnyj*) > length (short/*korotkij*) > height (tall/*vysokij*) > speed (fast/*bystryj*) > depth (shallow/*melkij*) > width (narrow/*uzkij*) > weight > temperature > wetness (dry/*sukhoj*) > age (elderly/*požiloj*) > shape > color (white/*belyj*) > nationality/origin (English/*anglijskij*) > material (stone/*kamennyj*). To this arrangement, she adds a lowest type that she extrapolates from Scott as being a 'typing attribute' (northern/*severnyj*) (Pereltsvaig 2007:63). Pereltsvaig then surveys English and Russian speakers with tokens, testing the ordering of a series of two adjectives modifying a noun. She notes that default, neutral ordering corresponds to an indefinite reading of the noun phrase.

In Pereltsvaig's study, respondents are asked to rate the relative order of the two adjectives and told to exclude interpretations that included comma intonation or contrastive focus (presumably to ensure an indefinite interpretation). English speakers were given tokens where the noun phrases used indefinite articles. Within these parameters, Pereltsvaig finds that 11.5 % of the Russian respondents disagreed with ordering that follows Scott's hierarchy, while a similar percentage of the English speakers (11.4%) also disagreed. She does note that if the two adjectives are from categories far apart on Scott's hierarchy, then it is more likely that respondents favor the

hierarchical ordering, whereas when they come from closer or adjacent categories, there is more likelihood of disagreement. From this she concludes that the apparent free word ordering in Russian (as a Slavic, article-less language) does not preclude interpreting a predetermined adjectival order as more preferable under a neutral interpretation in much the same way as it is understood in languages with articles such as English.

Word ordering restrictions related to QP, DemP, PossP, and NumP have also been used to propose a more complex nominal structure for Czech (Veselovská 2014) and BCS (Progovac 1998, Leko 1999) but without specific discussion of ordering restrictions among attributive adjectives specifically. Veselovská (2014) conducted a corpus study first to determine the rate of pre- versus post nominal modifier occurrence and secondly to note any statistical preference for a specific order of modifiers. She found that the majority of the tokens in the Czech National Corpus followed a ‘DemP > PossP > NumP’ ordering similar to that found in both English and Russian in unmarked contexts. Similarly, Leko (1999) established a neutral-context ordering in Bosnian of ‘DemP > PossP > NumP’ to which she adds a definiteness FP that she calls DefP to account for those instances where BSC modifiers exhibit the *i*-form declensions for masculines.

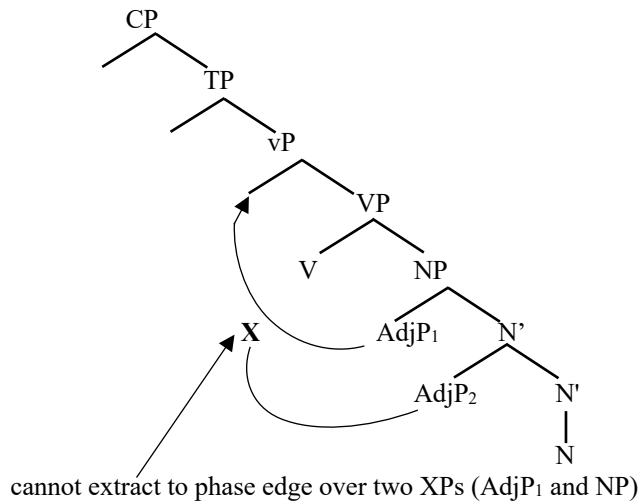

As mentioned, Bošković (2016) too notes that demonstratives must sit on top of an noun modifier ordering hierarchy. Thus, despite their adjectival morphology, denotationally, they pick out an individual and as a result can’t be further modified. Even though he considers demonstratives to be adjectives, he agrees that they must necessarily be composed above any other modifier, thus placing them at the top of the NP. For example, the demonstrative *ovu* in (16a) sits on the edge of its NP (*ovu skupu kolu* ‘this expensive car’). It must occupy this top position, because being a word of type <<et>e>,

it combines with the denotation of the phrase *skupu kolu* ‘expensive car’ which is of type $\langle et \rangle$ and yields an individual denoting expression (of type $\langle e \rangle$). Consequently, *skupu* will always be in a position below *ovu*, composing first with *kolu*. In the presence of *ovu*, *skupu* cannot occupy the position at the edge of the NP (a phase edge in Bošković’s theory). According to Bošković, because *skupu* occurs below *ovu*, it is not able to exploit the PIC of an NP phase as demonstrated by the ungrammaticality of (16b).

- (16) a. *ovu_i* *je* *kupio* *t_i* *skupu* *kolu*
 this.F.ACC_i AUX buy.M.PST *t_i* expensive.F.ACC car.F.ACC
 ‘He bought this expensive car.’
- b. **skupu_i* *je* *kupio* *ovu* *t_i* *kolu*
 expensive.F.ACC_i AUX buy.M.PST this.F.ACC *t_i* car.F.ACC
 Intended: ‘He bought this expensive car.’

The blocking function of demonstratives is explained as a result of their having to precede other adjectives. Because they will always be the highest position in the NP (i.e. the phase edge), the extraction of any second or subsequent adjective is prohibited due to antilocality.

Figure 2.4 No DP BCS structure with double adjectives

While scrambling is claimed for BCS (and other Slavic languages), demonstratives must always precede other adjectives in Slavic (Bošković 2005, Pereltstvaig 2007). Even among attributive adjectives, as Pereltstvaig (2007) shows, sometimes ordering restrictions exist that may indicate differences in meaning, a situation that would not obtain if true scrambling were taking place. Such findings problematize the assertion made by Bošković that in article-less Slavic languages, all words showing adjectival morphology are semantically equivalent (<et>) and can appear in any order. Bošković does acknowledge in a footnote (ftnt. 8, pp. 8-9), that there actually are some restrictions on adjunct ordering, although he doesn't mention this as counter evidence to his assertion that morphologically adjectival forms in BCS means that BCS has scrambling (Bošković 2005:8). In the footnote, he provides the minimal pair in (17) and (18).

- (17) bivša Jovanova kuća
 former.F.NOM John's.F.POSS.NOM house.F.NOM
 'the house John formerly owned'
- (18) Jovanova bivša kuća
 John's.F.POSS.NOM former.F.NOM house.F.NOM

‘John’s former house’ (i.e., the building he owns used to be a house)

Such data contradicts his own argument that the unordered, recursive adjunction of modifiers is a basic feature of the no DP structure he proposes. The more salient point for him to contrast DP and no DP is that, “[w]hat is important here is the contrast between English and SC [*Serbo-Croatian*] with respect to the permutability of the elements in question” (p. 8).

As noted above, Bošković uses specific modifier orders to explain why some adjectives at phase edges are able to extract while others are not while still maintaining that these ordering contexts are not syntactic in nature. Adjectives may appear in any order and unacceptable orders are simply eliminated by semantics and prosody (Bošković 2016:10). Consequently, he does not pursue what syntactic mechanisms might nonetheless be at work in these cases where modifier orders seem to be relevant even in his no DP analysis.

2.3.2 *Adjective Ordering and LBE*

Revisiting Bošković’s (2016) examples of ordered adjectives on the phase edge, his sample phrases are repeated here as (19) and (20).

(19) *Mašinskog_i je on otpustio [_{NP} neozbiljnog
 mechanical.M.ACC_i AUX.M.SG he fire.PST [not serious.M.ACC
 [_{NP} t_i [_{NP} inženjera]]].
 [t_i [engineer.M.ACC]]]
 Intended: ‘He fired a mechanical engineer who was not serious.’

(20) ?Neozbiljnog_i je on otpustio [_{NP} t_i [_{NP} mašinskog
 not serious.M.ACC_i AUX.M.SG he fire.PST [t_i [mechanical.M.ACC
 [_{NP} inženjera]]].
 [engineer.M.ACC]]]
 Intended: ‘He fired a mechanical engineer who was not serious.’

Again, he doesn't explain why *neozbiljnog mašinskog inženjera* 'unserious mechanical engineer' should necessarily be the assumed underlying order. I would like to suggest, however, that what is at issue is the semantics of the nominal phrase *mašinskog inženjera* 'mechanical engineer' where *mašinskog* 'mechanical' is used as what Scott calls a "typing modifier" (i.e., it specifies what type of engineer is being talked about), and therefore it always needs to be directly adjacent to the noun that it modifies (see, e.g., Svenonius 2008, Kim 2019). This required ordering ensures that *mašinskog* 'mechanical' is always the lowest modifier when used in the sense it is used here. If the restriction that one adjective be required to adjoin below another is not in effect, then extraction from any other type of double adjective construction (again, under contrastive focus) should be permitted as long as we assume that the extracted adjective is base-generated higher than the one left in situ. Still, in explaining phase edge extraction from a double adjective phrase Bošković (2016) only provides another example where a double adjective construction uses an adjective in an idiomatic construction: *brzog* 'quick' in (21). Such idiomatic usage associates the "typing" adjective more closely to the noun, creating a unit that is not able to further divide. Even in a single-adjective construction, it is unlikely that "typing" adjective would extract. (p. 11).

(21)a. Bošković example showing extraction of 'first' adjective:

Mladog _i	su	angažovali	t _i	brzog	napadača.
young.M.ACC _i	AUX.3.PL	hire.PST	t _i	quick.M.ACC	striker.M.ACC

'They hired a young quick striker.'

b. Bošković example showing 'second' adjective as not extractable:

?Brzog _i	su	angažovali	mladog	t _i	napadača.
quick.M.ACC _i	AUX.3.PL	hire.PST	young.M.ACC	t _i	striker.M.ACC

Again, according to Bošković, the circumstances under which an adjective may undergo LBE when it co-occurs with another adjective, are: if a) the extracting adjective is the first in the string of adjectives and b) the extraction is occurring under contrastive focus. Otherwise, in Bošković's schema, adjectives in double-adjective constructions cannot extract.

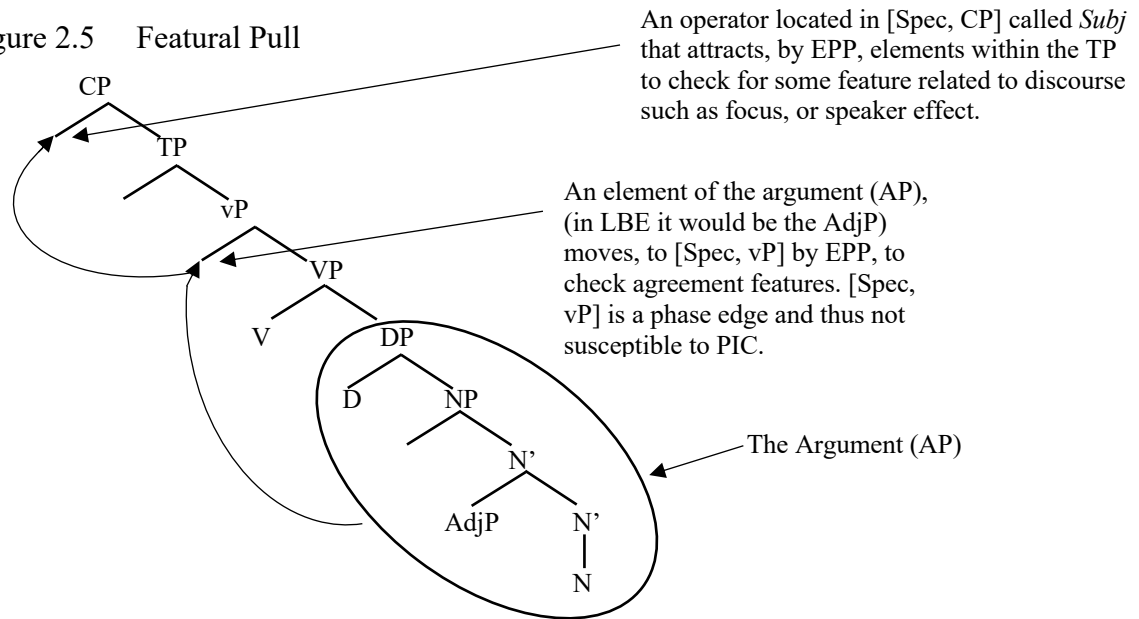

2.4 Focus Movement

Although he names contrastive focus as a motivation for LBE, Bošković's (2005, 2009, 2014, 2016) work does not directly address the discourse-related aspects of LBE. The EPP that is at the top of his nominal structure attracts the extracting modifier; the EPP operator therefore expresses some left-periphery, likely D-linked feature. Bošković (2005, 2016) does note that BCS is a "focus movement language"; and he makes contrastive focus a condition for LBE from double adjective constructions. He does not distinguish among different kinds of focus (intonational, specificational, contrastive). By *focus*, Bošković (2005, 2016) sometimes means intonational focus and sometimes contrastive focus. Moreover, along with focus, Bošković (2005) mentions "topicalization" (p. 3), as well as "θ-theoretic considerations" (p. 38) as motivations for LBE. If the motivation is focus, then D-linked features such as presupposition, exhaustivity, and referentiality are likely relevant to the role of focus to the process of LBE as Rizzi (1997) suggests.

In Rizzi 1997, "operator-like" focused elements end up in what he calls the "complementizer layer" (i.e., the CP domain), in a structural position that, in cartographic terms, sits atop the TP (tense phrase, inclusive of IP and VP), a layer at the left periphery of the phrase. Rizzi also notes that the elements that move for focus end up being

interpreted as focused as opposed to just checking off a feature. What draws the elements to the left-periphery is a function of the EPP to which Rizzi ascribes a criterial function that he calls Subj (Rizzi 2016). The element becoming the Subj is fulfilling a featural criterion, like Question, Topic or Focus. For Rizzi, a complementizer is the locus of communication between the propositional content expressed by the TP below it and the discourse requirements above it. In terms of discourse (i.e., the outward facing function of a CP), the CP layer establishes whether the sentence is a question; something relational, as in phrases joined with relative pronouns; or whether it provides “the structure to host an operator of the required kind” (Rizzi 1997:4). The discourse-related functions he calls, after Chomsky (1995), the specification of Force. An extracted noun modifier, which ends up at the beginning of a phrase, therefore, most likely represents an item that has moved out of its NP due to the featural pull of an operator that is present at the left periphery, as depicted in Figure 2.5 below.

Figure 2.5 Featural Pull

2.4.1 The Rizzian Concept of Focus

Within the realm of Force, CP functions can be described in terms of Topic-Comment structure and Focus-Presupposition structure, where preposing elements to the left periphery on the CP layer comes about due to the need to either topicalize or focalize some element (Rizzi 1997). Rizzi contends that there is a Spec-head relationship for both Topic and Focus structures. For Topic, a topicalized element is the Spec of a Top head with the comment as the complement, and for Focus, the focused element ends up as the Spec of a Foc head with a presupposition as its complement, as schematically represented in Figure 2.6 and 2.7, respectively (examples from Rizzi 1997:286-287).

Figure 2.6 Rizzian Topic-Comment Structure

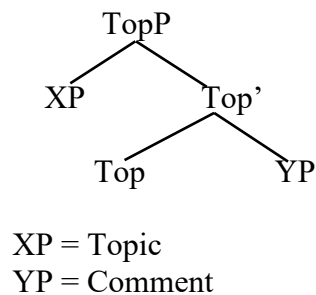

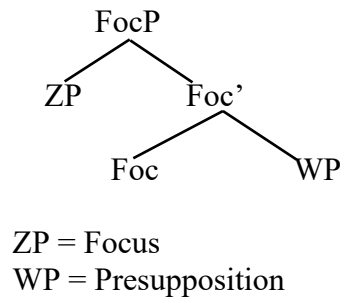

Figure 2.6 Rizzian Focus-Presupposition Structure

However, it is not the case that all languages prepose focalized elements or only prepose some kinds of focalized elements. Rizzi notes that this position can be used for elements that bear focal stress, or those that introduce new information, or the left periphery position may be reserved solely for elements expressing contrastive focus. Some languages, such as French, do not use a structural focus position at all. Rizzi mentions several types of focus (contrastive, focally stressed, non-contrastive, structural) all under the term focus while still noting that not all of them necessarily occupy the left periphery. Nonetheless, it is instructive to use Rizzi 1997 as a starting point because of his elaboration of Topic and Focus as specifications of Force (i.e. a D-linked operation). At the same time, the terms *topic* and *focus* are often used interchangeably and distinguishing them as separate instantiations of Force may be difficult to do (Kiss 2017).

Most useful in Rizzi's analysis are the observations that: 1) when structural movement does occur, there is likely a predicate structure (a focused element in [Spec FocP] with a presupposition as its complement); 2) that this structure only appears when the discourse requires it (i.e. it is not a fixed projection that must always be present); and 3) that while there may be multiple left edge positions for a Topic-Comment structure, there is only one position for a Focus-Presupposition structure. In light of this, the LBE sentences should be amenable to focus interpretations both under Rizzi's (1997)

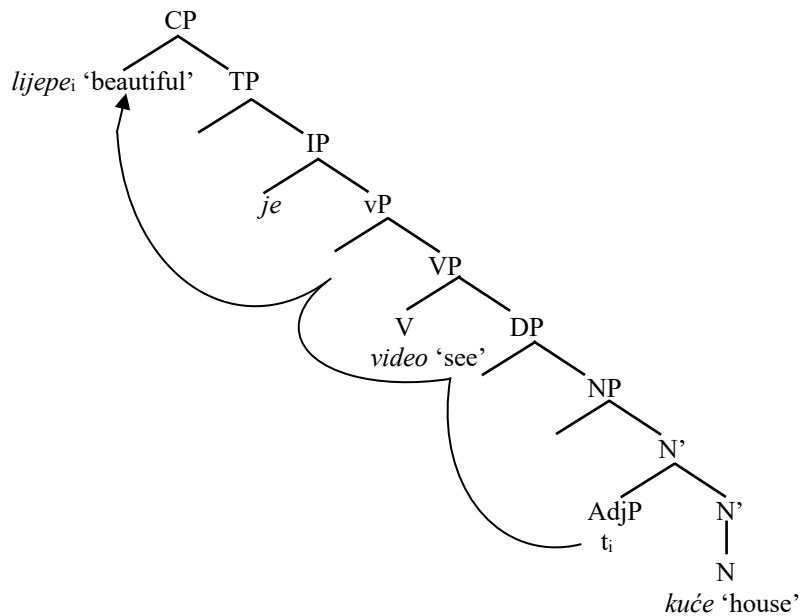

conception of elements at the left periphery and in Bošković's (2005) passing reference to focus movement as the basis of LBE. If LBE can occur within an expanded DP structure (rather than requiring a structure with no DP), then that structure should be assumed to accommodate focus-moved elements. Consequentially, the relationship between focus movement and the referential role played by D heads needs to be defined. In order to identify what type of focus movement is involved in LBE, and how it may interact with encoding referentiality and other types of discourse-related phenomena, a more fine-grained distinction of focus type such as that developed by Kiss (1998, 2017) is relevant.

2.4.2 Kiss and Specifical Focus

Working from Rizzi 1997, Kiss (1998) takes pains to distinguish among several things that are commonly included under the term *focus* to identify structural focus as the type of focus that characteristically involves movement and often involves an abstract operator and an interpretation related to exhaustivity. That is to say, other things that are identified as focus may be elements under intonational stress or elements that represent discourse-new information, regardless of their position or the intonation. Such elements however are not structural focus in Kiss's terms. Focus that is strictly about new information does not always require movement and, depending on the language, is often accompanied by what is called "focalizing" intonation. This type of focus is not equivalent to what Kiss means by structural focus. In both Rizzi and Kiss, focus movement creates what they call a "predicate structure" in that the focused element predicates something about the presupposed element that is left in situ. In Kiss's view, structural focus creates a predicate structure; the focused element moves to a structural

position because of an abstract operator and it creates a predicate structure where the focal element functions as a specificational predicate for the subject. Such movement can be shown using a simple BCS LBE datum we have already seen:

Figure 2.8 Focus Movement in BCS manifested by LBE

The subject here would then be *kuće* ‘house’, and the focused *lijepe* ‘beautiful’ predicates some specification about the house, namely that the house is beautiful.

To apply Kiss’s concept of structural focus movement to the movement found in LBE, the in-situ noun can be seen as referring to a subject whose existence is presupposed within the discourse, whereas the fronted modifier would be the predicate, i.e., the property that holds true of the subject. Consider an LBE token such as the following:

- (22) zelenu kupila haljinu
 green.F.ACC buy.F.PST dress.F.ACC
 ‘She bought a green dress.’

The existence of the dress is presupposed in the discourse; the interlocutors know that a woman bought a dress. The LBE'd modifier, *zelenu* 'green' says something about, or predicates the presupposed dress by focalizing the specific dress that was purchased. Such predication is said to be exhaustive in that it picks out a specified member of the set presupposed by the subject of the NP (i.e., the noun). Focused elements at the left-periphery do not necessarily have to express structural focus. If a focused element is not exhaustive, then a focused element appearing at the left periphery is likely not representative of structural focus in Kiss's view.

2.4.3 Russian Topicalization as Focus Movement

Structural focus is a parameterized feature not found in all languages (Kiss 1998). Other languages often treat focus differently. For its part, what is called 'focus' in Russian linguistics, is not the type of focus Kiss discusses. At the same time, Russian analyses of focus require some terminological adjustment to make them comparable to Kiss's theory. Most discussions of Russian treat *focus* and *focalization* as equivalent to informational focus, which, in the absence of intonational stress, typically means a focal element occurring at the end of a sentence. Focus movement of the type that Kiss describes, with operator-initiated movement to the left periphery receiving an exhaustive interpretation, is closer to what is identified as "topicalization" in Russian linguistics. Russian uses the terms *theme* and *rheme* to describe discourse structure, where the theme is what the sentence is about and rheme is what is said about the theme (Bailyn 2012). These terms are often used interchangeably with *topic* and *focus*, where *topic* is the information known from the discourse and *focus* is what is said about the topic. In Russian, the most common sentence ordering always places the theme before the rheme.

A focalized element can start a phrase but only if it is heavily stressed. The term *focus* for the sort of structural position proposed by Kiss is never used in Russian because that term is already used more specifically for intonational focus and theme/rheme discussions. In treatments of focus, Bailyn (2012) he concludes that there is no structural position for focus in Kiss's sense in Russian, because rhemic focus is never on the left periphery without strong intonation. Similarly, contrastive focus in Russian also demands strong intonational stress whether it is in a left periphery position or not.

Bailyn (2012) does describe the fronting of phrasal elements in Russian, but only in terms of *topicalization*. He doesn't equate his definition of topicalization with Kiss's idea of focus movement, although those two processes appear to be similar. That is, movement similar to what Kiss calls "structural focus" does occur in Russian when an element moves to the left periphery instantiating LBE, leaving a trace behind. That LBE'd phrase bears Case because its trace is in the argument position, and it is subject to movement constraints, such as the inability to move out of a relative clause. These constraints also hold for the phrasal movement that Kiss describes as structural focus. It is likely that the processes are the same, but the difficulty here resides in the use of the term *focus*. Although I will continue to use the term *focus* in the remainder of this dissertation, it is worth noting that a similar process in Russian is specifically identified as 'topicalization'. It may be more correct to suggest that for all article-less Slavic languages, it is probably the case that the movement causing LBE is conditioned by a specificational feature in [Spec, CP] related to something relevant in the discourse, whether we call that specificational feature *focus* or not.

Nonetheless, the definition of *focus* as developed by Kiss (1998, 2017) is used as the basis for testing Bošković's (2005) contention that LBE is focus movement in the present study. To this end, the hypothesis to test is one where contexts for focus should easily yield LBE'd results. In order to ensure that most aspects of the various uses of the term *focus* are covered, different types of focus will be addressed as well (specificational, contrastive, corrective). However, because of the nature of the dispute against uniform semantics for AdjPs as developed in theories promoting complex DP structure (Pereltsvaig 2006, 2007, 2013; Progovac 1998; and Rappaport 2000), Bošković's initial contention that any prenominal modifier can extract and is only disallowed at PF is also tested. Adjectives, despite their common morphology are here classified into sub-classes based on their semantics, following the categories described by Heim and Kratzer (1998). The expectation is that it is not possible to extract all classes modifiers that are morphologically adjectival under conditions of focus. Given this, the question is: if it is not focus, then what triggers or licenses LBE? Providing an answer to this question is one of the goals of the present dissertation, as we will see in the next three chapters.

CHAPTER III

QUESTIONNAIRES AND INTERVIEWS TO PROBE LBE

As mentioned in Chapter II, Bošković's (2016) view is that semantics and prosody serve as a filter to surface-level acceptability of LBE'd forms but they do not influence the underlying structure allowed by the syntax. Assuming that LBE is motivated by an operator at the left periphery, it is appropriate to say that LBE is responding to what Rizzi (1997) calls the specification of Force, i.e. the pressures arising from discourse contexts. With this in mind, the research goal of the dissertation is to devise an instrument with which to determine whether there is any contextual pattern related to adjective ordering restrictions (base generation and movement of nominal modifiers) and focus type that may account for what is allowable as LBE. To this end, questionnaires were developed to determine the parameters of discourse contexts for LBE using the framework of varied combinations of adjectival categories and focus type. Because LBE primarily targets modifier extraction, the first aim of the research was to determine whether there are restrictions on the types of adjectival modifiers that can extract while controlling for the type of focus within which such extractions can occur. At the same time, because Bošković (2005, 2009, 2014, 2016) claims that all article-less Slavic languages lack DP structure, a uniform instrument was initially developed with the expectation that it would yield similar results across the three article-less Slavic languages: BCS, Czech, and Russian. The questionnaires were developed in conjunction with native consultants and piloted with anonymous groups of native speakers of BCS, Czech, and Russian. Using a uniform questionnaire is to determine whether speakers of all three languages do indeed share the same grammaticality judgments regarding LBE.

Shared judgment would thus support Bošković's view that the mechanism of LBE in article-less Slavic languages is a function of the no DP structure he proposes for them.

3.1 Participants

The bulk of the scholarship related to LBE effects centers on BCS (Zlatić 1997, Bošković 2005, 2008, 2009, 2012; and Despić 2011, 2013) and often uses de-contextualized sample phrases (see the various Bošković examples in 2005, 2009, 2010, 2016, or Despić 2011, or Talić 2019). This study, by contrast, compares the observations from the literature with data taken from contextual scenarios. In addition it examines acceptable forms comparatively, using BCS as a South Slavic language, Czech as a West Slavic language and Russian as an East Slavic language. A control comparison using a version of Questionnaire I was also administered to a small group of speakers of Bulgarian, a South Slavic language that does have articles. While access to Russian, Czech, and Bulgarian speakers was relatively unrestricted (personal acquaintances), BCS speakers needed to be recruited and were somewhat less accessible. However, due to the fact that a large amount of the current scholarship on LBE is already primarily centered on BCS, the participants who were recruited for BCS mostly only needed to provide judgments on the data already in the literature.

A female acquaintance who is a native Russian speaker from Tomsk, in Siberia, gave input on the design of the initial questionnaire, using her intuitions about the types of scenarios that would be appropriate for eliciting tokens with focused adjectives. The tokens were pre-designed to follow the syntax of the sample tokens from Bošković (2005, 2016). This initial set of scenarios and tokens was written up in an English version that was then presented both to a female BCS speaker from Novi Sad and a female Czech

speaker from Prague for editing and translation. This process made it possible to control for the situation described in the scenario, while ensuring that the language used is idiomatic and natural to native speakers. The first set of contextual scenarios provides the background for the given LBE tokens comprising Questionnaire I (Q1) (Appendix A). This questionnaire was then put online as a Google Form. The respondents for the Russian version were recruited by a Texas Tech University Russian professor on my behalf by communicating with his friends and acquaintances living in Russia. The Czech respondents were recruited from friends and acquaintances of the consultant in Prague, and the BCS respondents were recruited anonymously through the BCS-oriented group *Kako biste VI rekli?* (How would YOU say it?) on Facebook where many researchers post language queries about BCS.

The respondent populations varied in terms of age, geographical location and linguistic knowledge. The only demographic information that was gathered was age and sex. While it is possible that some of the BCS respondents were familiar with the scholarly work on LBE because the Facebook group is used by academic linguists, this familiarity was less likely for the Russian and Czech respondents. The three Bulgarians queried for the control questionnaire are all employees of Texas Tech University, and come from the cities of Varna, Sofia, and Ruse in Bulgaria, but currently live in the US. The Bulgarians were sent the QI text in English and asked to provide a “natural” response in Bulgarian to the given scenarios. They were also presented with a sample, Bulgarian-language text from Stojković (2019) (discussed below) and asked to respond about whether they thought the forms in the sample sounded natural or grammatical to them. All of this interaction took place through email.

Questionnaire II was conducted as a one-on-one discussion with each consultant. For this questionnaire, the Russian consultant was switched to a male native speaker from Voronezh while the BCS and Czech consultants remained the same.⁸ For Questionnaire III, a new BCS consultant (male, also from Novi Sad) was recruited and several interviews were conducted with him via Zoom and email.⁹ All of the Czech and Russian consultations were conducted through email. The BCS and Czech discussions were conducted in English with only the choice of adjective given in the target language, whereas the discussion with the Russian consultant was conducted in Russian. Once discussion developing QIV with the consultants was completed, the questionnaire was made available again as an online Google form for all three languages. For Russian, the consultant asked three friends who were willing to be contacted for further questions to fill out the questionnaire. The Czech consultant (as explained below) was asked to find six separate people to fill out the two Czech versions of the questionnaire. For BCS, the questionnaire was again advertised through the Facebook group, *Kako biste VI rekli*.

⁸ The initial Russian consultant was no longer available.

⁹ The initial BCS consultant was no longer available.

Table 3.1 Overview of Research Consultants and Questionnaires

Target Language	Consultant(s)	QI	QII	QIV ¹⁰
Russian	1. Female, Tomsk 2. Male, Moscow	Online Google form translated by Consultant #1	One-on-one interviews in Russian with Consultant #2 via email	Online Google form translated by Consultant #2
		Respondents recruited by TTU Russian professor		Respondents recruited by Consultant #2
BCS	1. Female, Novi Sad 2. Male, Novi Sad	Online Google form translated into BCS by Consultant #1	One-on-one interviews in English with Consultant #2 via Zoom and email	Online Google form translated by Consultant #2
		Respondents recruited through FB group		Respondents recruited through FB group

		Respondents recruited by Consultant		Respondents recruited by Consultant
Bulgarian	Female, Varna Female, Sofia Male, Ruse	Bulgarian response to English version of QI via email	n/a	n/a

3.2 Questionnaire I: Adjective Categories and Specificational Focus

There were two assumptions made in the design of QI:

1. that LBE can be the result of structural focus movement and that a specificational-type of focus would be likely to create grammatical LBE forms; and

¹⁰ QIII was not distributed. The reason for this will be explained below.

2. that the category of adjective extracted would affect the acceptability of that movement.

In order to determine whether the categorial type of the adjective plays a role in LBE, the first questionnaire was created using short scenarios that could serve as the context for utterances typifying extraction under Kiss's (2017) definition of specificational focus. The scenarios were designed to allow the suggested utterances to vary by four categorial types of adjective (intersective, subjective, modal, or privative).

3.2.1 Intersective, Subjective, Modal, and Privative

Attributive adjectives can be classified as intersective, subjective, modal or privative. This follows the classifications identified by Kamp and Partee (1995) as follows.

(1) Adjective Classifications

- Intersective: modifiers with meaning that is not dependent on the noun they modify: e.g., *red*, *round*
- Subjective: modifiers with meaning that is dependent on the noun they modify and where the modified nominal expression refers to a subset of all possible sets the noun would reference: e.g., *skillful*, *beautiful*, *tall*, *short*
- Modal: modifiers that create nominal expressions that can't describe a thing based only on the way things are in the world. The meaning they give to the noun may or may not be true: e.g., *alleged*, *potential*, *probable*
- Privative: modifiers that create nominal expressions that refer to things that don't presently exist: e.g., *former*, *fake*, *imaginary*.

Partee (2010) also uses these categories to help explain a restriction on the phenomenon in Polish known as “split nominals”. Splitting results from topicalization, where an adjective can be fronted leaving the N sentence final, or the N is fronted and the adjective is left in situ. She found that nominals modified by intersective, subsective, and privative adjectives can split, whereas those modified by modal adjectives cannot. This grouping led Partee to identify privative adjectives as “coerced” subsectives: they would be subsective but for the negation inherent in their logical expression (i.e. they refer *negatively* by negating the reference for the head noun; the referent is something “imaginary” or “fake”). Partee calls the grouping of privatives with intersectives and subsectives a situation of “presupposition accommodation” (Partee 2010: 274). The context for the interpretation of the head noun “coerces” the interpretation of the meaning of the adjective, thus pulling subsective type adjectives into intersective meanings. Examples of Polish split-nominals (in prepositional phrases) where privative adjectives cannot split are given by Partee (2010:277 and 2021:16 respectively) as follows.

- (2) a. do rozległej weszliśmy doliny
 to large.F.GEN enter.1PL.PST valley.F.GEN
 ‘We entered a large VALLEY.’
 b. do doliny weszliśmy rozległej.
 to valley.F.GEN enter.1PL.PST large.F.GEN
 ‘We entered a LARGE valley.’
- (3) a. *Z potencjalym widzieli się kandydatem
 with potential.M.INS saw.3P.PST REFL candidate.M.INS
 Intended: ‘They met with a potential candidate.’
 b. *Domniemanych spotkałismy złodziei
 alleged.M.P.ACC met.1P thieves.M.P.ACC
 Intended: ‘It was the alleged thieves we met with.’

However, this division into intersective, subjective, and privative adjectives on the one side, and modal adjectives on the other is not absolute, as evidenced by the following example (4) that Partee also provides (2010:278).

- (4) a. *Z byłym rozmawiała prezydentem
 with former.INS talk.2SG.F.PST president.INS
 Intended: ‘She talked with the former PRESIDENT.’
- b. *Z prezydentem rozmawiała byłym
 with president.INS talk.2SG.F.PST former.INS
 ‘She talked with the FORMER president.’

Partee conjectures that in the case of (4), the privative sense of the word glossed as meaning ‘former’ may be clearer in English than it is in Polish, and that it may have semantic features in Polish that tip it more into the category of modal. More generally, however, the distinction holds. On the assumption that the splitting observed for Polish, if not equivalent to LBE, is at least analogous to LBE, the expectation for the results of QI was that a similar restriction by adjective category would be observed.

3.2.2 *Specificational Focus*

The scenarios in QI were designed to create situations where the response (token) sentence would require the LBE’d adjective to be an attribute that constituted one of several possible choices. This type of focus is similar to contrastive focus in that a choice forms the basis for the selection. However, in the sense that Kiss (2017) defines the term, such type of focus involves a quantificational process as it presupposes a set of possible options from which the focused one is selected. The questionnaire was designed to determine if such quantificational focus movement served as a motivation for LBE in the languages studied.

3.2.3 *Design of Questionnaire I*

The initial questionnaire (Appendix A) was comprised of a series of eight scenarios. Associated with each scenario was a token sentence with an adjective extracted from its noun phrase and positioned at the beginning of the phrase in the manner shown in the majority of Bošković's tokens (2005, 2009, 2014, 2016). Respondents were asked to assess the grammaticality of the tokens relative to the given scenarios according to a four-point Likert scale: 'not grammatical/natural', 'marginally grammatical/natural', 'somewhat grammatical/natural', and 'perfectly grammatical/natural'. Each scenario and its token were designed around a specific category of nominal-modifying adjective: intersective, subsective, modal, privative (two tokens: a nominal-type privative and a verbal-type privative), demonstrative (two tokens: proximal and distal), and a possessive. Each questionnaire also allowed respondents to add comments about the sample sentences.

- (5) The Likert Scale ranking in the three languages (least acceptable to most acceptable)
- a. BCS: neprirodno / 1 / 2 / 3 / 4 / prirodno
 - b. Czech: gramaticky špatný / gramaticky ucházející / gramaticky celkem v
 pořádku / gramaticky perfektní
 - c. Russian: grammatičeski nevernoe / neskol'ko nevernoe / počti pravil'noe /
 grammatičeski pravil'noe

The first scenario used the intersective adjective meaning 'green' in a token produced to specify a green dress out of a set of several different colored-dresses. The utterance has an NP meaning 'green dress' functioning as the object of the sentence

meaning ‘She bought the green dress’. In the Slavic, LBE version, the focused element, the adjective meaning ‘green’ is extracted to the sentence initial position.

(6) QI Scenario 1: Intersective adjective token in the three languages:

- a. Zelenu je kupila haljinu (BCS)
green.F.ACC AUX buy.F.PST dress.F.ACC
‘It was the green dress she bought.’
- b. Zelené šaty si koupila (Czech)
green.F.ACC dress.F.ACC AUX bought.F.PST
‘It was the green dress she bought.’
- c. Zelenoe ona kupila plat’e (Russian)
green.N.ACC she buy.F.PST dress.N.ACC
‘It was the green dress she bought.’

The second scenario provided a setting to elicit a choice of the subjective adjective meaning ‘tall’. The respondent was asked to specify which of a set of physical attributes a newly hired workman should have. The answer specifies the hiring of a tall man with the sentence meaning ‘I prefer the tall man’. Again, the NP meaning ‘tall man’ is the object of the sentence and for the token, the adjective meaning ‘tall’ is fronted, leaving the noun in situ.

(7) QI Scenario 2: Subjective adjective token in the three languages

- a. Visokog preferiram kandydata (BCS)
tall.M.ACC prefer.1.S candidate.M.ACC
‘I prefer the tall candidate.’
- b. Vysokého preferuji chlapíka (Czech)
tall.M.ACC prefer.1.S guy.M.ACC
‘I prefer the tall guy.’
- c. Vysokogo predpočitaju ja človeka (Russian)
tall.M.ACC prefer.1.S I person.M.ACC
‘I prefer the tall person.’

Scenario three provides a situation where the utterance is meant to focus the modal adjective meaning ‘alleged’ to distinguish the specific thief identified in the scene, where the adjective is specificationally focused.

(8) QI Scenario 3: Modal adjective token in the three languages

- a. Navodnog je znala lopova. (BCS)
alleged.M.ACC AUX know.F.PST thief.M.ACC.
On joj je stric.
he her AUX uncle.M.NOM
‘It’s the alleged thief she knew. He’s her uncle.’
- b. Domnělého zná zloděje. (Czech)
supposed.M.ACC know.3S.PRS criminal.M.ACC
Je to její strejda.
AUX it her uncle.M.NOM
‘It is the supposed criminal she knows. It’s her uncle.’
- c. Predpolagaemogo ona znaet vora. (Russian)
alleged.M.ACC she know.3S.PRS thief.M.ACC
On ejo djadja
He her uncle.M.NOM
‘It is the alleged thief that she knows. He is her uncle.’

Scenario four’s token has the privative adjective meaning ‘former’ extracted in the utterance in the context of a situation where the speaker is specifying that of the possible chairmen who could have been interviewed, the former chair was the one selected. Each adjective meaning ‘former’ in (9) represents a privative adjective with a more verbal sense and the adjectives meaning ‘fake’ in (10) one that is more nominal in character.

(9) QI Scenario 4: Verbal privative adjective token in the three languages

- a. Bivšeg je videla direktora (BCS)
former.M.ACC AUX saw.F.PST director.M.ACC
‘It was the former director she saw.’
- b. Původního jsem navštívila vedoucího. (Czech)
previous.M.ACC AUX met.F.PST leader.M.ACC
‘It was the previous leader I met with.’
- c. Byvšego vstretila ja predsedatelja (Russian)
former.ACC meet.F.PST I chairman.M.ACC
‘It was the former chairman who I met with.’

Then in scenario five, the privative adjective meaning ‘fake’ is focused as a selection between an actual passport (or a pistol in the Czech version¹¹) and a false one.

(10) QI Scenario 5: Nominal privative adjective token in the three languages

- a. Lažni im je pokazao pasoš. (BCS)
 fake.M.ACC him.DAT AUX show.M.PST passport.M.ACC
 ‘He showed him a fake passport.’
- b. Falešnou Petr nosí pistoli. (Czech)
 fake.F.INS Peter carry.3SG.PRS gun.F.INS
 ‘Peter carries a fake gun.’
- c. Fal’šivj pokazal on passport. (Russian)
 false.M.ACC show.M.PST he passport.M.ACC
 ‘He showed a fake passport.’

Scenarios six and seven provided LBE’d tokens using the demonstrative pronouns “this” and “that” respectively. Trying to design a scenario where only a distal or a proximal demonstrative pronoun is specificationally focused is difficult, as many scenarios using a distinction between demonstratives are contrastive, or, if one is focusing something, the proximal demonstrative is typically chosen regardless. However, for scenarios six and seven, the tokens specifically stated the required demonstrative, although many respondents did remark that the sentences sounded odd, not because of the extraction, but because of the choice of the demonstrative.

(11) QI Scenario 6: Distal demonstrative token for the three languages

- a. Onu želim hemijsku. (BCS)
 that.F.ACC want.1SG.PRS pen.F.ACC
 ‘I want that pen.’
- b. Tamto chci pero (Czech)
 that.N.ACC want.1SG.PRS pen.N.ACC

¹¹ The Czech consultant was not satisfied with the example for the privative adjective and felt that using a noun phrase meaning ‘fake pistol’ gave a more believable scenario.

‘I want that pen.’

- c. Tu hoču ja ručku (Russian)
 that.F.ACC want.1SG.PRS I pen.F.ACC
 ‘I want that pen.’

(12) QI Scenario 7: Proximal demonstrative token for the three languages

- a. Ovu je kupio stolicu. (BCS)
 this.F.ACC AUX buy.M.PST chair.F.ACC
 ‘He bought this pen.’
- b. Tohle koupil křeslo (Czech)
 this.N.ACC buy.M.PST chair.N.ACC
 ‘He bought this chair.’
- c. Etot on kupil stul (Russian)
 this.M.ACC he buy.M.PST chair.M.ACC
 ‘He bought this chair.’

Finally, scenario eight allowed for the extraction of the adjectival possessive pronoun meaning ‘your’.

(13) QI Scenario 8: Possessive token for the three languages

- a. Tvoja mi treba kniga (BCS)
 your.F.NOM me.DAT need.3.PRS book.F.NOM
 ‘It’s your book I need.’
- b. Tvoji potřebuji knihu (Czech)
 your.INST need.1.SG book.INST
 ‘It’s your book I need.’
- c. tvoja mne nužna kniga (Russian)
 your.F.NOM me.DAT need.F.PRED.ADV book.F.NOM
 ‘It’s your book I need.’

Each sentence token for scenarios 1-7 was in the format of ‘adjective + subject and transitive verb + object noun’, as shown in (14).

- (14) 1. Green + she bought/bought + dress
 2. Tall + I prefer + man
 3. Alleged + she knew + thief

4. Former + I met + chairman
5. Fake + he presented + passport/Fake + Petr + carried + pistol
6. That + I want + pen
7. This + I bought + chair

For scenario 8, the Czech version (13b) uses an object in the instrumental case. However, both BCS and Russian have the noun phrase ‘your book’ in the subject case (nominative). In BCS, the expression is an impersonal expression where what is needed is the subject and who needs it is the indirect object (13a). Similarly, in Russian, the person who needs something is an indirect object, and the needed thing is the subject and instead of a verb, Russian uses an agreeing predicative adverb (13c).

The sentence form in scenarios 1-7 is the canonical LBE format that Bošković provides for the bulk of the samples he gives in his writings (Bošković 2005, 2008, 2016). Because all three of these Slavic languages indicate direct objects for transitive verbs with the accusative case, all of the agreeing, extracted adjectives in QI scenarios 1-7 were designed to show accusative case and were clearly modifying the direct object nouns (Appendix A).

3.2.4 *QI Distribution*

After QI was translated, it was made available online through a Google survey form and respondents were either recruited by the consultant or acquaintances or responded to a posting in a Facebook group. Limited demographic information was gathered (sex, age) but there was no control of the population to ensure a random sample. 108 people responded to the Russian survey, 39 to the Czech version, and 21 to the BCS.

3.3 Questionnaire II: Nominal and Verbal Privatives and Specificational and Contrastive Focus

QI did show that for those languages that accepted LBE of privatives, there was a tendency to favor nominative-type over verbal-type ones. Because of these results, a second, short, follow-up questionnaire, QII, was created specifically to query the three native-language consultants about the acceptability of LBE for noun-type privative adjectives compared to verb-type privative adjectives. The questionnaire was conducted as email interviews with the consultants. For the BCS and Czech consultants, the correspondence and the questionnaire were written in English, only the specific adjective was given in the target language. In this short questionnaire, the consultants were also asked to assess the grammaticality of privative tokens exhibiting LBE which have undergone movement for specificational focus and for contrastive focus, beginning with the first type of data (Appendix D).

The assumptions for QII were:

1. that there will be a difference in extractability between privative adjectives that are more noun-like and ones that can be interpreted in a more verb-like fashion; and
2. that adjectives that function more like relative clauses (i.e., the verb-like privatives) would be less likely to extract

3.3.1 Design of Questionnaire II

In the first scenario of the six scenarios in this questionnaire, the verbal type privative adjective “invented” was fronted in a sentence using specificational focus. This adjective, in all three Slavic languages, is derived from a verb.

(15) QII Scenario 1 verbal privative under specificational focus in the three languages:
'invented'

- a. zamišljeni (BCS)
- b. vymyšlený (Czech)
- c. vydumannij (Russian)

Then in the second scenario, the nominal privative adjective meaning 'fictitious' was used in a sentence with specificational focus.

(16) QII Scenario 2 nominal privative under specificational focus in the three languages:
'fictitious'

- a. fiktivni (BCS)
- b. fiktivní (Czech)
- c. fiktivnyj (Russian)

In the third scenario, the verbal privative meaning 'former' is used in a sentence with contrastive focus.

(17) QII Scenario 3 verbal privative under contrastive focus in the three languages:
'former'

- a. bivši (BCS)
- b. bývalý (Czech)
- c. бывšij (Russian)

And finally, scenario four used the nominal privative meaning 'fake' in a contrastively focused sentence.

(18) QII Scenario 4 nominal privative under contrastive focus in the three languages:
'fake'

- a. lažni (BCS)

- b. falešný (Czech)
- c. iskusstvennyj (Russian)

As with ‘invented’, ‘former’ is typically expressed with an adjective derived from a verb, in this case, the participial form of the verb “to be”. These four scenarios were given to the individual consultants to comment on.

3.4 Survey of Bulgarian Consultants using QI

Parallel to the first two questionnaires (QI and QII) administered to Russian, Czech, and BCS speakers, a survey was taken with Bulgarian speakers. As a non-LBE language, a Bulgarian questionnaire could not provide LBE tokens. However, the Bulgarian consultants (n=3) were given the original scenarios from QI in English and asked to estimate a colloquial (spoken) response to each scenario where they would specificationally focus the adjective. All three consultants provided several possible token sentences for each scenario and gave a short explanation of their choices. The table in Appendix C shows their answers.

3.4.1 Proposed LBE in Bulgarian

In addition, the consultants were asked to judge the grammaticality of a proposed Bulgarian LBE token from Stojković 2019. In that study, Stojković claims that some LBE is possible in Bulgarian despite the presence of DP. She theorizes that Bulgarian projects a DP in order to syntactically represent the definite article which then lowers to its post adjectival or post nominal affixal position and then the DP is “exfoliated” allowing for a path to extraction. Stojković’s (2019:347) sample scenario, reproduced in (19), was presented to the Bulgarian consultants.

(19) In your opinion, for each of Sara and Maria's sentences in the scenario/dialog copied below (marked as A, B, C), how would you rank them?

The range is: (1) = sounds totally fine, (2) sounds sort of fine, (3) sounds a little off, (4) sounds totally off

Sara i Marija pijat kafe. v əgəla na stajata sa
Sara and Maria are drinking coffee in corner.DEF of room.DEF are

obuvkite na Marija. Sara zabeljazva edni červeni obuvki
shoes.PL.DEF of Maria. Sara notices some.PL red.PL shoes.PL

'Sara and Maria are drinking coffee. In the corner of the room are Maria's shoes. Sara notices a pair of red shoes.'

a. S: Obuvite sa tvoi?
shoes.PL.DF are your.PL?
'S: Are those your shoes?'

b. M: Ne, ne, Ana gi kupi i zabravi tuk onija den.
no, no, Ana them bought and forgot here other.DEF day
'M: No, no, Ana bought them and forgot them here the other day.'

c. S: Červenite kupi obuvki? Az ne gi haesvam
red.PL.DEF bought.3.S.PAST shoes I not them like.1.S.PRES
'S: She bought the red shoes? I don't like them.'

None of the consultants produced an LBE sample in their responses to the QI scenarios and all three consultants rejected the Stojković token in the last scenario:

Červenite kupi obuvki 'It was the red shoes she bought'. Based on these responses, no further questionnaires were developed to test the acceptability of LBE in Bulgarian.

3.5 Questionnaire III: All Adjective Types, Three Types of Focus, and Emotivity

Questionnaire III was created in order to test the effects of both adjective category and focus type in licensing LBE. The intention was to try to test all adjective types within each kind of focus. A preliminary draft for QIII was drafted with the purpose of giving a targeted series of questions posed to the individual consultants using the same types of adjectives as in QI but in for the context of contrastive, specificational, corrective and

topic focus. A focus type used to indicate correction (correctional focus) was included because of specific comments concerning correction in response to comments on QII by the BCS consultant. Based on the comments offered for QI and discussion with the consultants about both QI and QII, the hypothesis was that there would be variation across focus types and across languages and that some kind of emotivity would play a role in all three. The three assumptions made for QIII were that:

1. LBE acceptability would vary based on focus type relative to adjective category,
2. LBE acceptability would correlate with emotivity; and
3. LBE acceptability would vary depending on the language

Emotivity was included also based on comments made by respondents and the consultants in all three languages. Emotivity refers in general to speaker effect. The BCS consultant mentioned “corrective focus”, while the Russian consultant also used “correction”, but in the context of being irritated or dismissive of the speaker’s statement. Two possibilities were considered: 1) this was the same type of pragmatic context or 2) some sort of emotivity plays a role in all cases though not of the same kind. Because of the variety of responses obtained for the questionnaires up to this point, emotivity in general was considered the more likely avenue to pursue. The draft of QIII can be found in Appendix E.

3.6 Questionnaire IV: Intersective Adjectives, Specificational, Corrective and Contrastive Focus, and Emotivity

Throughout the study, data collection was mostly impressionistic in that it relied on the individual views and idiolects of the consultants as well as the non-controlled-for populations who answered the online questionnaires. As QI had the most overall respondents, a matrix was created to try to find themes in the observations respondents provided in the comment box for the online survey (Appendix G). The last questionnaire, QIV, was created to target the language-specific issues that had arisen in these comments and during the course of discussion with the separate language consultants. Overall, there was less acceptance for LBE'd modal adjectives and more acceptance for intersectives. In general, Czech speakers were more likely to reject the LBE form altogether while simultaneously suggesting that demonstratives be used in the tokens, while BCS speakers were more likely to accept all LBE forms represented by the tokens. These results will be discussed at more length in Chapter IV. In addition, the consultants, at various points in the analysis of QI and in helping create QII, often made mention of speaker attitude possibly having some effect on interpreting the acceptability of LBE'd tokens.

The assumptions made for QIV and based on respondent comments were:

1. that speakers of all three languages were more likely to accept LBE of intersective adjectives,
2. that speaker attitude affects the acceptability of LBE'd forms: and
3. that indicating focus in Czechs may involve the insertion of demonstratives as well as fronting

3.6.1 Design of Questionnaire IV

In order to identify the nature of the variations suggested by the respondents of the first questionnaires, language-specific versions of QIV were developed: one for Russian, one for Czech (with two variants), and one for BCS that incorporated some of the issues related to adjunct extraction that arose in response to the first three questionnaires. The three versions of QIV were identical in that they all provided approximately the same three sets of scenarios. They differed however in the kinds of the tokens to be assessed for acceptability for each language.

For each scenario, there were two versions (a and b): one version of the scenario (a) was presented as the context for a neutral response and a second (b) introduced the likelihood that the person uttering the suggested response would be pronouncing it with some negative emotive affect (irritation, annoyance, exasperation, anger). Altogether there were six separate token sets presented: Ia) neutral for specificational focus; Ib) emotive for specificational focus; IIa) neutral for corrective focus; IIb) emotive for corrective focus; IIIa) neutral for contrastive focus; and IIIb) emotive for contrastive focus. The aim was to have consistency in that the cause of emotivity would be the fronted attribute, rather than a general irritation with a speaker. However, in deliberating with the three consultants, it became clear that it was more correct to consider the emotivity as a combination of the attribute and the person addressed. This meant that if one were talking about a person wearing a green, rather than a red dress, the emotivity expressed can be considered to be a combination of a reaction to the color of the dress and that person's decision to wear that color. In addition to providing a judgment of acceptability for the provided tokens, respondents were asked to supply a token that they

felt would be the most natural response to the scenario given the requirement that the attribute be focused.

3.6.2 Questionnaire IV Scenarios

Scenario I presents a context, as in the previous questionnaires, where the adjective describing the color of a garment is LBE'd. In scenario Ia, a group of women are together trying to help one of their group select clothing to wear for a party. One woman leaves before the decision is made and then later asks which outfit out of several, was chosen.

(20) Ia: Neutral for Specificational Focus.

You and your friends Masha and Daria are at Masha's house. You are helping Masha decide what to wear to a fancy party she's been invited to. She has tried on a red dress, a green dress, a black dress, and two pantsuits. Daria realizes that she was supposed to pick up her sister from school and has to leave while Masha is still deciding. The next day you are talking to Daria on the phone and she asks which outfit Masha ended up wearing to the party.

You reply using the following constituent order:

green + she wore + dress

In scenario Ib the woman who leaves early is said to have a clear preference for one outfit and considers the one chosen unflattering, hence creating a negative affect for the statement concerning the actual choice.

(21) Ib: Emotive for Specificational Focus.

You and your friends Masha and Daria are at Masha's house. You are helping Masha decide what to wear to a fancy party she's been invited to. She has tried on a red dress, a green dress, a black dress and two pantsuits. Daria says she can't wait any longer and has to go to another appointment, and she leaves. The next day Daria calls to ask which outfit Masha ended up wearing to the party. You thought the red dress was the best choice, but Masha picked the green one, which you thought was unattractive and fit her poorly. In this context, you reply using the following constituent order:

green + she wore + dress

For scenario IIa, a person has left a briefcase in the lobby of his office building and calls to see if the person working at a kiosk near where he left it has turned it in. The person answering the phone offers a description of a kiosk worker, emphasizing that she is wearing a yellow dress. The caller offers the token sentence correcting the person who answered the phone by fronting the adjective that highlights the fact that the caller is referring to a person wearing a green dress, not a yellow dress.

(22) IIa: Neutral for Corrective Focus.

You return home from work and realize you left your briefcase at the kiosk in the lobby of your office building. You call the building manager to find out if anyone turned it in. The manager asks if the person at the kiosk when you left the briefcase was a woman wearing a yellow dress. You explain, using the following constituent order, that it was a woman in a green dress, not a yellow dress.

green + she wore + dress

For IIb the scenario is revised to indicate that the caller not only affirms that it is a green dress, but that it is a dress he finds unattractive.

(23) IIb: Emotive for Corrective Focus.

You return home from work and realize you left your briefcase at the kiosk in the lobby of your office building. You call the building manager to find out if anyone turned it in. The manager says he doesn't know if it was turned in. You ask him if he can ask the woman working at the kiosk if she saw your briefcase. Finally, the manager asks "Do you mean the woman in the yellow dress?" However, you remember that the woman working at the kiosk was wearing a hideous-looking green dress. In this context, using the following constituent order, can you say:

green + she wore + dress

In scenario IIIa, a child is asked to wear a blue dress to a party but shows up wearing a green one. The token contrastively focuses the green dress over the blue one.

(24) IIIa: Neutral for Contrastive Focus.

Your daughter goes to a friend's house to play. The friend wants to do a pretend fashion show and tells your daughter to wear a blue dress. But your daughter wants to wear a green dress because she thinks it is prettier. She ends up going to the friend's house wearing the green dress, not the blue one. In this context, using the following constituent order can you say to the friend:

green + she wore + dress

In IIIb the scenario is described such that the parent uttering the token is unhappy with choice of green over blue.

(25) IIIb: Emotive for Contrastive Focus.

Your daughter goes to a friend's house to play. The friend wants to do a pretend fashion show and tells your daughter that for the show, all the outfits will be blue. But your daughter wants to wear a green dress because she thinks it is prettier. She ends up going to the friend's house wearing the green dress, not the blue one. You are concerned that the friend will not be happy with the green dress. In this context, using the following constituent order, can you say to the friend:

green + she wore + dress

3.6.3 The BCS Version of QIV

For a specificational context with neutral emotivity, in the opinion of the BCS consultant, a one-word answer would be the most likely response for scenario Ia. As a result, for the BCS version of QIV, this was offered as the token for Ia in the questionnaire.

(26) zelenu
green.F.ACC
'The green one'

At the same time, respondents were asked to provide a "full sentence" that the one-word answer was representing. For Ib as well as for IIa, IIb, IIIa, and IIIb, a full LBE'd sentence was given as the token. For Scenario Ib, in addition to the token being the full sentence version, the consultant suggested using an exclamation point to make the emotive meaning clearer in writing, as exemplified below.

- (27) Zelenu je nosila halinu!
 green.ACC AUX wore.FEM dress.ACC
 ‘It was a green dress she wore!’

For Scenario IIb, the BCS consultant also felt that using the word meaning ‘no’ at the beginning of the token expressing corrective focus would be the most natural response.

The token for IIb included the word meaning ‘no’ as a result:

- (28) **ne ne zelenu** je nosila haljinu!
 no no green.F.ACC AUX wore.F dress.F.ACC
 ‘No, no, it was the green dress she wore!’

In addition, respondents were asked to provide a token that they felt would be the most natural response for each scenario.

3.6.4 *The Czech Version of QIV*

For Czech, two different versions of QIV were tested. In both versions, the consultant suggested that the fronted adjective be accompanied by the demonstrative pronoun and the noun be excluded for Ia and Ib. One version (QIVa) provided full LBE versions of the tokens for IIa, IIb, IIIa, and IIIb while the other (QIVb) included only the adjective in the tokens.

(29) QIVa

- Ia) ty zelené si vzala
 that.ACC green.ACC AUX took.FEM
 ‘She took that green (one).’

- Ib) ty zelené si vzala
 that.ACC green.ACC AUX took.FEM
 ‘She took that green (one).’

- IIa) zelené měla šaty
 green.ACC had.FEM dress.ACC
 ‘It was a green dress she had.’

- IIb) zelené měla šaty na sobě

green.ACC had.FEM dress.ACC on self
'It was a green dress she had on her.'

IIIa) ty zelené si vzala šaty
that.ACC green.ACC AUX took.FEM dress
'She took that green dress.'

IIIb) ty zelené si vzala šaty
that.ACC green.ACC AUX took.FEM dress
'She took that green dress.'

(30) QIVb

Ia) ty zelené si vzala
that.ACC green.ACC AUX took.FEM
'She took that green (one).'

Ib) ty zelené si vzala
that.ACC green.ACC AUX took.FEM
'She took that green (one).'

IIa) zelené měla
green.ACC had.FEM
'It was a green (one) she had.'

IIb) zelené měla na sobě
green.ACC had.FEM on self
'It was a green (one) she had on her.'

IIIa) ty zelené si vzala
that.ACC green.ACC AUX took.FEM
'She took that green (one).'

IIIb) ty zelené si vzala
that.ACC green.ACC AUX took.FEM
'She took that green (one).'

3.6.5 The Russian Version of QIV

The Russian consultant was asked to look at the scenarios which I had translated into Russian for Questionnaire IV (Appendix F) and give feedback. In his first response, he indicated that all the tokens sounded perfectly fine in the scenario contexts given although he suggested a different verbal construction ('decided to wear' rather than 'wore') for Scenario Ia. The consultant was then sent several follow-up questions where he was asked to confirm his belief that there is no difference in meaning if the adjective is

fronted or even placed elsewhere in the sentence. He was also asked if there was any difference in the likelihood of using the fronted form when irritated as opposed to in a neutral context.

When asked generally about changes in meaning with alternative word orders, the consultant repeated that the ordering showed less than the intonation did, supporting the general view of Russian topic/focus structure as accompanied by intonational stress. He noted that Russian has relatively free word order, although he was aware of there being some orders that don't work. He did maintain however that the word order in the examples for QIV doesn't affect the meaning of sentence. His impression of word ordering in Russian is that it is delimited by language habits, peoples' preferences, by the degree of interest in the discussion topic and also to the ease of articulation with the adjacent words. For example, he said that in some dialogues (as in QI, Scenario IV, with the salesperson and the person buying the pen) the word order in the answering phrase might be limited in comparison to the word order of the example sentence, in which case, the speaker conveys annoyance because repeating the phrasing of the person you are speaking with shows your irritation with that person.

In order to find some way to narrow down any possible relationship between LBE and a contextual type of adjunct movement, the consultant suggested giving two scenarios, one providing a neutral context and the other providing a context with probable emotional coloring on the part of the speaker, but then allow the respondents to order the sentence constituents however they felt was most appropriate. In corresponding with the Russian consultant, there was a good deal of discussion about simplifying the complexity

of each scenario and as a result the descriptions were made much briefer for the Russian version. The revised versions were as follows (see Appendix F for the Russian).

(31) Russian Scenarios for QIV

- Ia. Some friends were choosing a dress for Tatyana. One of the friends had to leave quickly and therefore didn't know which dress was chosen. She called later and asked which dress they bought Tatyana. She was told: 'I bought the green dress' (green + I bought + dress).
- Ib. Some friends were choosing a dress for Tatyana. One of the friends had to leave quickly and therefore didn't know which dress was chosen. Tatyana, after having bought the green dress found out that her friend didn't like it. That friend called later and asked which dress they bought. Having bought the green dress, Tatyana answered irritably: 'I bought the green dress' (green + I bought + dress).
- IIa. You were at a store and forgot your gloves at one of the counters. Arriving at home, you call the manager of this store and ask if they've found any gloves. The manager asks "Did you leave your gloves near the saleswoman in the yellow dress?" You answer: 'The one wearing a green dress' (in green + she was + dress).
- IIb. You were at a store and forgot your gloves at one of the counters. Arriving at home, you call the manager of this store and ask if they've found any gloves. The manager asks "Did you leave your gloves near the saleswoman in the yellow dress?" You impatiently and rudely reply to the manager, who you consider an idiot: 'The one wearing the green dress' (in green + she was + dress).
- IIIa. A certain Tanya came to the party in a green dress. Your close friend asked you what Tanya was wearing. Please arrange the following words in the order that will best convey that information objectively: 1. 'Tanya', 2. 'green', 3. 'was', 4. 'dress', 5. 'in'.
- IIIb. For some reason you are very displeased that this woman Tanya came to the party in a green dress. With indignation you mention this to your friend. Please arrange the following words in the order that will maximally, fully express your annoyance: 1. 'Tanya', 2. 'green', 3. 'dressed', 4. 'dress'.

CHAPTER IV

RESULTS

4.1 Introduction

The questionnaires developed for this study represent successive attempts to test the theory that the discourse context for LBE is focus and that the (semantic) type of focused adjective may constrain its ability to extract. This hypothesis was derived both from the assertion that LBE is focus movement (Bošković 2005, 2016) and the various theories of expanded nominal structure for Slavic in relation to adjective ordering based on adjectival syntax (Progovac 1998; Leko 1999; Pereltsvaig 2006, 2013; Veselovská 2014). QI looked at the four adjectival categorial types, intersective, subsective (i.e., nominal and verbal), modal, and privative, as well as the distal and proximal demonstrative pronouns, and a possessive adjective under conditions of specificational focus. From the general trends observed in the BCS, Czech, and Russian results for QI, QII was developed to test a hypothesis about the extractability of privative adjectives specifically, while the focus type was broadened to include contrastive focus as well as specificational focus. QIII was drafted but never administered for reasons given in Chapter III. QIV was then developed to help get a clearer picture of language-specific trends, using only the intersective adjectival category, three types of focus (specificational, corrective, and contrastive), and scenarios that alternated between neutral and emotive contexts for the tokens. In the development of QIV, the decisions to use only an intersective adjective, to provide a variety of focus types, and to include emotivity were informed by the trends observed in the previous versions of the questionnaires as elaborated in Chapter III. In addition, the results from each iteration of

the questionnaire informed the format of the following questionnaires. The results do not represent a comprehensive study of the phenomena and are best viewed as preliminary pilot tests of focus in discourse contexts. Similarly, only the most broad conclusions can be made in connection with tendencies found in the answers to the questionnaires. Consequently, in this dissertation, I only offer relatively preliminary conclusions, and they should help inform the direction of future research.

4.2 Responses from Questionnaire I: Adjective Categories and Specificational Focus

The first questionnaire, QI, included the four adjective category types (intersective, subsecutive, modal, and privative) while controlling for specificational focus. Because Kiss notes that specificational focus is different from focus stress or topic focus in that it necessitates movement, the hypothesis was to test whether typical LBE sentences in Slavic exhibit this particular type of focus as the motivation for the fronting. From the grammaticality judgments and coding of respondent-provided comments for QI, several trends and issues arose. The results showed a general trend for Czechs to reject LBE'd forms overall, for Russians to have mixed responses and for BCS speakers to accept most LBE forms (though their acceptance levels are not as high as Czech rejection levels). All three languages showed dispreference for the LBE of a modal adjective. All three languages showed at least some acceptance for LBE for an intersective adjective.

4.2.1 *General Response Trends*

The most likely comment given by questionnaire respondents was to explain how or why some of the tokens were unacceptable to speakers of their language. Some respondents remarked that certain scenario and token combinations sound “unnatural”.

(1) Comment responses from QI: Stylistically unnatural

a. BCS

Sve su rečenice iste. Ne znam zašto neke deluju manje prirodno.

‘All the sentences are the same. I don’t know why some seem less natural.’

Nikad nisam čuo da izvorni govornik izgovara takve rečenice.

‘I have never heard a native speaker utter such sentences.’

b. Czech

Podle mne jsou slohově špatné všechny.

‘In my opinion, every sentence is bad in style’

Nejsem si jistá termínem "gramaticky špatná". Spíše jsou to věty stylisticky špatné.

‘I’m not sure of the rating ‘not grammatical’. Rather, the sentences are stylistically wrong’

c. Russian

Очень странные предложения, все звучат неестественно, даже если представить себе просодическое оформление.

‘These are very strange sentences, they all sound unnatural, even if you imagine a prosodic version.’

Очень странный и неестественный порядок слов в предложениях. Я могу представить контекст, когда такой порядок может подойти, но я никак его не вижу в предложенных ситуациях.

‘There is very strange and unnatural word order in these sentences. I can imagine a context when such an order might work, but I can’t see it with the given situations.’

The most common complaint was to say that the token sentence was incorrect.

Even though all of the questionnaires were developed with the assistance of native speakers of the respective languages, many respondents gave comments similar to the following: “that’s not how we speak in our language” or “that is how Master Yoda speaks.”

(2) Comment responses from QI mentioning “Yoda”

a. Czech

...v CR obecně nemluvíme jako yoda, i když je samozřejmě mega cute.

‘...in the Czech Republic we generally don’t talk like Yoda, although of course it’s mega cute.’

b. Russian

2 и 4 в любой ситуации будут звучать, как речь Йоды из "Звездных войн" в русском дубляже.

‘2 and 4 in any situation will sound like Yoda from ‘Star Wars’ with Russian dubbing.’

The second most common type of comment was to state that the forms are only used in “spoken language” with a couple of respondents (one Czech and one BCS) conversely stating that the forms would only be used in literary language. Because so many people insisted that the forms were “wrong” and because a large number of Russians (n=14) mentioned that the tokens might be acceptable if the speaker was expressing a negative attitude, the consultants were asked to comment specifically on the role that emotivity might play in the acceptability of such data. Beyond these trends, comments varied in type by language.

Table 4.1 General Trends: Least Acceptable-Most acceptable

	Modal: ‘alleged’				Intersective: ‘green’			
	% acceptable	% somewhat acceptable	% unacceptable	% somewhat unacceptable	% acceptable	% somewhat acceptable	% unacceptable	% somewhat unacceptable
BCS	16.7%	29.2%	37.5%	16.7%	37.5%	12.5%	29.2%	20.8%
Czech	2.6%	7.7%	66.7%	23.1%	10.3%	23.1%	33.3%	33.3%
Russian	13%	13%	58.3%	17.7%	37.6%	32.1%	12.8%	17.4%

4.2.2 *QI BCS Results*

Acceptability Responses

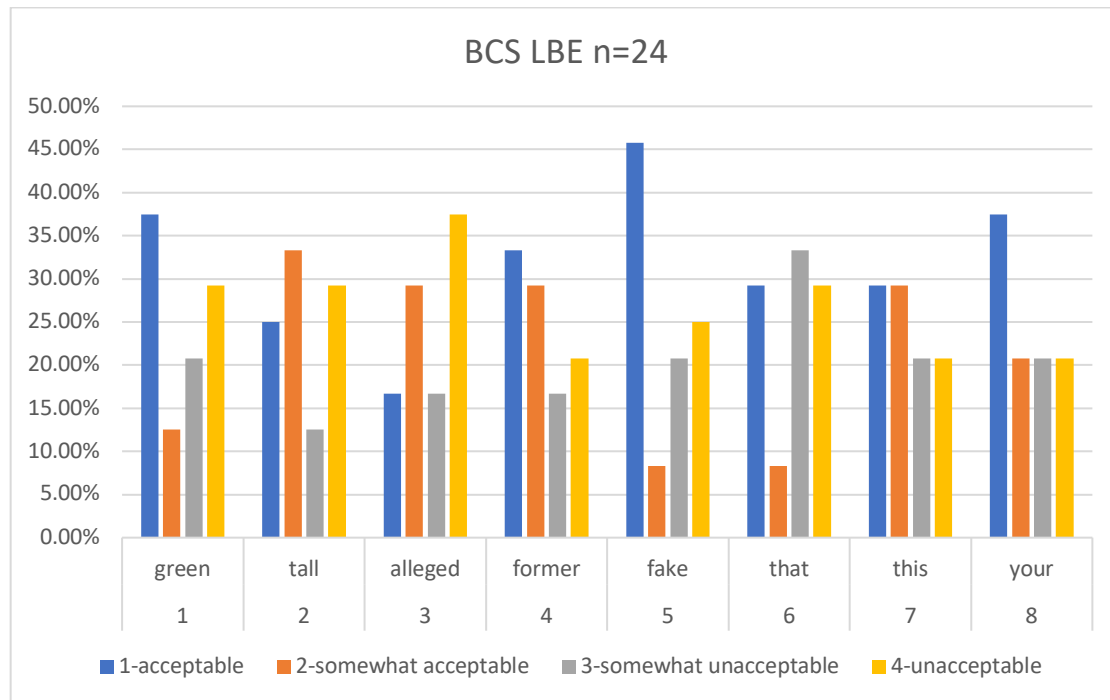

For the BCS questionnaire, 24 people responded and information about them is given in Table 4.2.

Table 4.2 BCS Respondents to QI

Age	20-29	30-39	40-49	50<	Did not say
Male n=3	5	5	8	3	6
Female n=20					
Didn't say n=1					

With the exception of the adjective meaning ‘tall’ (subsecutive) and the adjective meaning ‘alleged’ (modal), more people found the LBE’d versions acceptable than found them unacceptable. In addition, the results for the distal demonstrative *onu* ‘that’ showed slightly more people finding it somewhat unacceptable (33.3%) or unacceptable (29.2%) than found it acceptable (29.2%) or somewhat acceptable (8.3%). This token yielded unexpected results in all three languages. In discussing this with the consultants, they suggested that focusing a distal object makes it more natural to refer to the object using the proximal demonstrative. For example, when you focus ‘that thing’, focusing on ‘thing’ makes it more natural to refer to it as ‘this thing’. That is to say, putting focus on a distal object turns it into a proximal object in many cases, thus making the questionnaire’s scenario and token confusing for respondents. The remaining categorial types showed a somewhat narrow difference between acceptance and rejection. None of the forms were overwhelmingly rejected.

Figure 4.1 BCS Responses to QI

Comments

Of the 24 people who responded to the BCS version of QI, eight people provided extra comments. The most common response (n=5) were people commenting that they accepted the LBE token but that it didn't sound entirely "natural" to them. For scenarios 3 and 4 (modal and verbal privative) there were comments calling out the tokens as inappropriate for the given scenario. One commenter said that the passport situation didn't sound realistic. Without mentioning a specific scenario, one commenter said that such statements would never be made in response to the given scenarios but may be appropriate in other circumstances. When asked about the possibility of emotivity playing a role, especially negative emotions, the consultant said that she didn't think negativity would necessarily play a role. She noted that the most common use would be to express contrast with some other existing alternative. Overall she believes that its most common

use would be to correct someone. Examples expressing this given by the consultant are shown in (3).

(3) Mirjana je kupila zelenu haljinu?
 Mirjana AUX bought green.FEM.ACC dress.FEM.ACC
 ‘Mirjana bought a green dress?’

Nij-e. Plavu je kupila haljinu.
 not-AUX blue.FEM.ACC AUX bought dress.FEM.ACC
 ‘No. It was a blue dress she bought.’

Because of this observation, corrective focus was included in Questionnaire IV.

4.2.3 *QI Czech Results*

Acceptability Responses

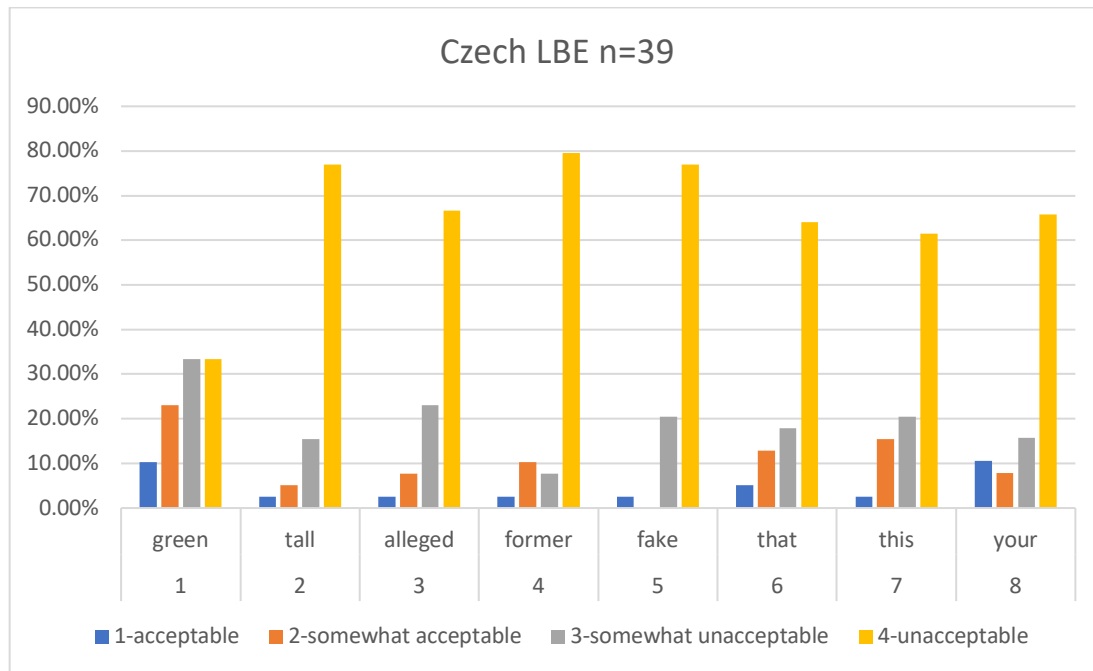

39 people responded to the Czech version of QI.

Table 4.3 Czech Respondents to QI

Age	20-29	30-39	40-49	50<	Did not say
Male n=9	3	4	5	23	4
Female n=27					
Didn't say n=3					

Unlike the BCS responses, the Czech respondents overwhelmingly rejected LBE forms. All but the intersective adjective showed rejections by over 60% of the respondents. The intersective *zelené* ‘green’ and the possessive determiner *tvoji* ‘your’ showed the highest acceptance rate but only at 10%. In both cases, a larger proportion of respondents (33.3% and 65.8% respectively) rejected the form. However, the intersective adjective showed the lowest percentage overall of those rejecting it (33.3%). The nominal privative adjective *falešnou* ‘fake’/‘false’ is notable in that 30 of the respondents found it “unacceptable”, 8 found it “somewhat acceptable” and only one respondent found it “acceptable”. None of the other tokens had so few people accepting the form.

Figure 4.2. Czech Responses to QI

Comments

13 people answering the Czech version of QI provided additional comments.

Even though respondents overwhelmingly rejected LBE'd forms, the Czechs did appear to be familiar with them in that some commented that they were more likely to show up in the spoken language (n=3). None of the commenters mentioned emotivity. However, two respondents said that stress intonation would make the tokens acceptable. Three people also commented that one-word answers (i.e. just the adjective) would be a more natural response to the scenarios. Several Czech respondents suggested fronting the entire NP (no LBE) and using a demonstrative with it. When the Czech consultant was asked about whether emotivity would improve the acceptability of the tokens, she stated that putting a demonstrative pronoun ("this") in front of the LBE'd adjective would both make the form more acceptable in her view and would indicate that the speaker was annoyed with the person they were speaking with because they would expect that person

to already know the answer they are calling attention to by using the demonstrative. As a result of this observation about demonstrative usage, this form was included in the Czech version of QIV. Because all three language consultants allowed some role for emotivity in making the LBE'd forms more acceptable, this feature was included in all three versions of QIV.

4.2.4 *QI Russian Results*

Acceptability Responses

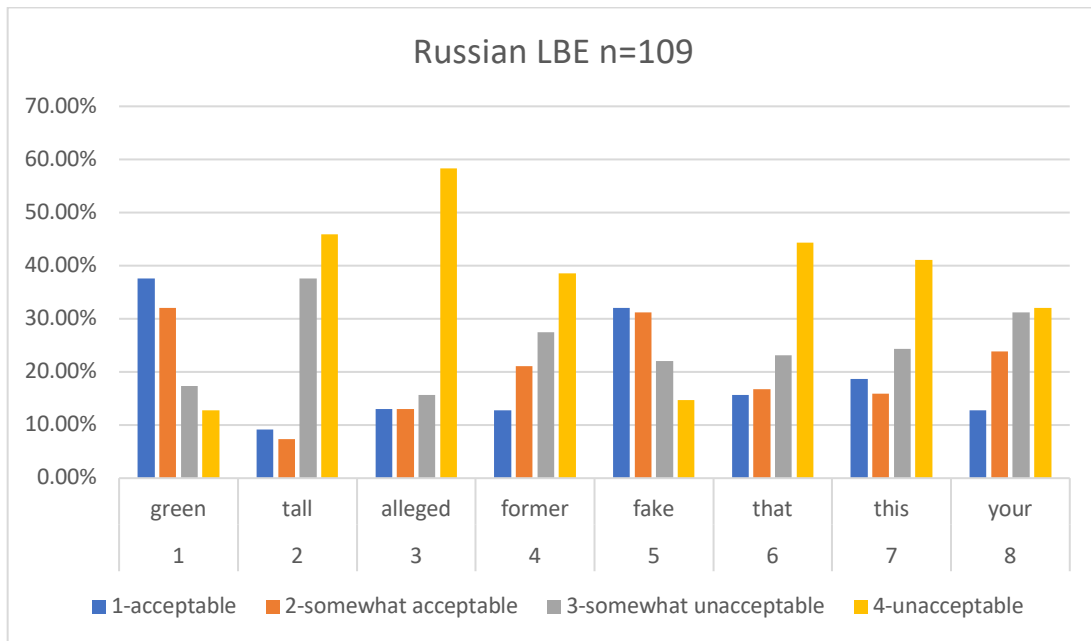

109 people responded to the Russian version of QI.

Table 4.4 Russian Respondents to QI

Age	20-29	30-39	40-49	50<	Did not say
Male n=39	25	29	24	20	4
Female n=66					
Didn't say n=4					

As with the BCS questionnaire, the most accepted LBE'd tokens involved the intersective adjective *zelenoe* 'green' at 37.6%, and the nominal privative adjective *falšivij* 'fake' at 32.1%, and the least acceptable form involved the extracted modal adjective *predpolagaemogo* 'alleged' where 58.3% rejected the token. The remaining tokens demonstrated decreasing acceptability among respondents.

Figure 4.3 Russian Responses to QI

Comments

Of the 109 QI respondents, 45 left additional comments. For their part, the Russians were more likely (n=15) to comment that the tokens could be acceptable, but under different scenarios. They suggested that the forms did not sound ungrammatical, but that they did not sound appropriate to the given scenarios. The second most common comment was to note that the tokens would make sense if they meant to express some kind of negativity. 13 people commented that the most natural response for the scenarios was a one-word answer using just the adjective. A few people (n=4) took issue with the verb *predpočitat* 'prefer' in the token for scenario II (testing the behavior of the subsecutive adjective), noting that it sounded odd when used to refer to a human being. When the Russian consultant was queried about pragmatic situations, his judgment was that emotivity could play a role in conjunction with other factors like prosody. For scenarios 2, 3, 4, 5, and 7 (subsecutive, modal, both privatives, and the proximal

demonstrative respectively), he felt that the tokens and contexts seemed neutral. For scenario I (which was meant to test the behavior of an intersective adjective), however, he felt that it made slightly more sense in a context where the token is uttered with a negative attitude towards the choice of the green dress. That is to say, to express the opinion that Maria was an idiot for choosing that particular color, perhaps because it did not suit her. For scenarios 6 and 8 (which were about the behavior of a proximal demonstrative and that of a possessive determiner), the consultant felt that even asking a question about a situation that should be visually obvious (e.g., ‘which pen’ or ‘which textbook’) could be seen as a bit aggressive on the part of the speaker. Additionally, four respondents felt that adding the emphatic particle *da* in front of the LBE’d adjective might be necessary for the expected contexts.

4.2.5 *QI Bulgarian*

The scenarios from QI were presented in English to three Bulgarian consultants (see Appendix C). They were asked to indicate what they thought would be the most natural way to respond to each scenario while focusing the specified adjectives. Because the scenarios were designed to elicit specificationally focused adjectives, the question became how such focus would most naturally be expressed in the absence of the possibility of LBE movement. As expected, no LBE forms were produced. All three consultants gave answers with the suffixal definite article on the focused adjective. For the first scenario with the intersective adjective, the consultants gave the following responses:

- (4) a. Zelena-ta roklja
 green-the dress
 ‘The green dress’

- b. Zelena-ta
green-the
'The green (one)'
- c. Da, zelena-ta roklja
yes, green-the dress
'Yes, the green dress.'

For all of the scenarios, the consultants similarly gave either one-word answers using just the adjective with the definite article (*-ta* in the examples here) or sentences with either the noun or the verb elided as shown below:

- (5) a. Izbra zelena-ta
chose.3.SG.PST green-the
'She took/chose the green (one)'
- b. Zelena-ta roklja
green-the dress
'The green dress'

Not all of the consultants gave one-word answers in the same case, however. For example, one consultant consistently answered with one-word answers for the masculine nouns while expressing them with the accusative case. Another consultant alternated between nominative case and accusative case. As a result, it is difficult to make a statement about the underlying form for Bulgarian speakers and whether it involves movement or ellipsis. The Bulgarian consultants also showed a preference for inserting demonstrative modifiers in front of the focused adjective similarly to the Czechs.

All three of the Bulgarian speakers were given the Stojković (2019) scenario, which purported to show acceptable LBE in Bulgarian as mentioned in Chapter III (see Section 3.4.1). As shown in (6), none of them accepted that form.

- (6) Červenite kupi obuvki? Az ne gi haresvam
red.PL.DEF bought.3.S.PST shoes I not them like.1.S.PRES
'She bought the red shoes? I don't like them.'

One consultant suggested that adding the accusative case-marked demonstrative pronoun *tija* ‘these’ before *červenite* ‘red’ would improve the acceptability of the token, but the example she gave completely elided the noun as shown in (7).

- (7) *Tija červenite li kupi? Na men ne mi haressvat*
 these.PL.DEF.OBJ red.PL.DEF Q bought of me not me.DAT like
 ‘You bought these red ones? In my opinion I don’t like them.’

Additionally, she remarked that a “more natural” phrasing for expressing a negative judgment could be made with the addition of stress intonation on the word meaning ‘red’ as shown in (8).

- (8) *Tezi ČERVENITE obuvki ili kupi?*
 those.PL.DEF red.PL.DEF shoes Q bought
 ‘You bought those red shoes?’

Stojković’s (2019) theory posits a DP within which the article in Bulgarian occurs before it lowers to a suffixal position, but then that DP “exfoliates” (that is, the DP layer disappears) in order to allow LBE (see Chapter III). It is therefore notable that one of my Bulgarian consultants’ alternative to the LBE form had a demonstrative occur in a position that would be only available if there is a DP structure still present in Bulgarian.

4.3 Responses from Questionnaire II: Nominal and Verbal Privatives and Specificational and Contrastive Focus

QII was a short, four-scenario questionnaire distributed by email to the Russian, Czech and BCS consultants. The questionnaires sent to the Czech and BCS consultants were in English, only the specific adjectives to be considered for the LBE extraction samples were given in the consultant’s language. The Russian consultant was sent a version of the questionnaire in Russian. The first two scenarios required a response

exhibiting specificational focus, the first using a verbal privative adjective and the second a nominal privative adjective. The third and fourth scenarios required responses demonstrating contrastive focus, the first with a verbal privative adjective and the second with a nominal privative adjective. The consultants then read through the scenarios and sent back to me their opinions about the grammaticality of tokens that would show the privative adjectives extracted (see Chapter III for details).

4.3.1 *QII BCS Responses*

The questionnaire sent to the BCS consultant was in English with the following adjectives in BCS supplied: verbal privative in specificational focus, *zamišljeni* ‘invented’; nominal privative in specificational focus, *fiktivni* ‘fictitious’; verbal privative in contrastive focus, *bivši* ‘former’; and nominal privative in contrastive focus, *lažni* ‘fake’. This last could arguably also be considered verbal from the verb *lagati* ‘to lie’. The consultant felt that all four scenarios easily allowed tokens with the adjectives extracted. She saw no difference in extractability between the types of privative adjectives nor among the different types of focus. Her sole observation on this point was that she considered herself a “permissive” speaker.

4.3.2 *QII Czech Responses*

For scenario I (which was about testing the behavior of a verbal privative under specificational focus), the Czech consultant responded that putting the adjective in the first position only made sense to her if the noun came with it. She also noted that a demonstrative would need to precede the adjective.

- (9) Ten vymyšlený příběh nám řekněte
 that.M.ACC made up.M.ACC story.M.ACC us.DAT tell.IMP
 ‘Tell us the made-up story.’

She indicated that a specificationally focused version of the token with the nominal privative meaning ‘fictitious’ would result in the same sentence but with the adjectives exchanged.

The third and fourth scenarios allow for a contrastively focused privative adjective. Scenario III used the verbal privative *bývalý* ‘former’ in the following construction: *about the former + I am talking + version*, the consultant did not believe you could extract the adjective. Instead, she said you could simply respond with the accusative case-marked adjective by itself (*bývalý*) or insert a demonstrative pronoun and elide the noun.

- (10) O tom bývalém mluvím
 about that.M.LOC former.M.LOC talking.1.PL.PRES
 ‘We are talking about that former (one).’

Regarding the nominal privative in contrastive focus, *falešný* ‘false’, the consultant stated that the situation would be identical: either one could answer with the adjective by itself in the accusative case, or one could elide the noun while using a demonstrative before the fronted adjective as shown in (11).

- (11) Ty falešné přesuňte
 those.PL.ACC fake.PL.ACC move.IMP
 ‘Move those fake (ones).’

In sum, then according to the consultant, there appears to be no difference between nominal and privative adjectives either in specificationally or contrastively focused in terms of extractability. In all cases, the consultant did not feel that an LBE form would be acceptable.

Corver's LBE Tokens

The consistency with which Czech speakers reject LBE'd tokens brings up the question why, other than its status as an article-less Slavic language, Bošković (2005) included it in his claims for LBE. In his work, Bošković cites Corver (1990, 1992) as supporting the claim that LBE is also a feature in Czech. For Corver, Czech is an example of a language that regularly violates Ross's (1967) principle of LBC prohibiting extraction in languages like English.

Corver gives the following sentences as examples of extraction in Czech.

- (12) Jak pěkná Jan potkal děvčata?
 How beautiful.ACC Jan met girls.ACC
 'How pretty are the girls John met?'

- (13) Jakou by Jan dal knížku Markovi?
 Which.acc cond Jan gave book.acc Mark.dat
 'Which book could John give to Mark?'

- (14) Její čte Petr knihu!
 Her reads Peter book.acc
 'Peter reads her book!'

- (15) Tu čte Petr knihu!
 This.ACC reads Peter book.ACC
 'Peter reads this book!'

Consultant Responses to Corver's Tokens

Neither Corver nor Bošković reports on the specific pragmatic contexts within which these LBE tokens might most naturally occur. It is therefore not possible to control for pragmatic context in comparing the appropriateness of LBE in Corver's samples relative to the samples in QI, QII, and QIV. However, in order to test the possibility that there may have been an unremarked-upon pragmatic situation suggested by Corver's

examples that was inherently more conducive to LBE, his original sentences were sent to the consultant for her to assess. She replied that all of the sentences sounded “unnatural”.

The consultant showed a clear preference for not extracting the adjective while also still pronouncing the noun. Either the entire phrase is fronted, or the modifier is used by itself and the noun was elided. Using the modifier by itself was acceptable to her even when it does not bear overt case marking (as in *její* ‘her’) as long as the noun was elided entirely. It should be noted that in the qualitative data for QI for Czech, several respondents commented that this form (the modifier by itself) would be the “more natural” response to the scenarios with modifier under specificational focus (see Chapter V for further discussion of these tokens).

4.3.3 *QII Russian Responses*

For the scenarios in QII (see Appendix D), the Russian consultant took issue with the word choices. In the process of exchanging several emails, he helped create more plausible scenarios and tokens, but was still not comfortable with the suggested LBE forms. For the first scenario, with the extracted verbal privative *vydumanij* ‘invented’ he felt that it could easily be extracted as in the suggested token but that it would make the most sense if accompanied by focal stress as well. He did not think that there would be any emotive content to having it in the first position as opposed to anywhere else in the sentence.

For the verbal privative, the consultant suggested a different scenario and suggested the following LBE sentence.

(16) **Fiktivnyj** on khotel zaključit’ s etoj
 fictional.M.ACC he want.M.PST to conclude with this.F.INS

russkoj	ženščinoj	brak	čtoby	polučit'
Russian.F.INS	woman.F.INS	marriage.M.ACC	in order	to get
graždanstvo	Rossii			
citizenship.N.ACC	Russia.F.GEN			

'He wanted to enter into this fictional marriage with this Russian woman in order to get Russian citizenship.'

Because the consultant came up with this phrase, the type of focus couldn't be controlled for but it is most likely specificational because of his use of *etoj* to modify the woman (presumably to distinguish the specific situation involving this woman from any other possible situation). The consultant's observation was that you could use such word ordering for any scenario, not just for focus. He identified this phrase as more appropriate to conversational speech. He also gave a form of this sentence with stress on a sentence-final adjective meaning 'fictional' as shown in (17), which is typical for Russian theme-rheme structure. In that case, the English translation of the sentence would use an indefinite nominal for *russkoj ženščinoj*, suggesting that the entire noun phrase of which *fiktivnyj* is a part is indefinite.

(17) Čtoby	polučit'	graždanstvo	Rossii,	on	khotel
in order	to get	citizenship.N.ACC	Russia.F.GEN	he	want.M.PST
zaključit'	c	russkoj	ženščinoj	brak	
conclude	with	Russian.F.INS	woman.F.INS	marriage.M.ACC	

fiktivnyj
fictional.M.ACC

'In order to get Russian citizenship, he wanted to enter into a fictional marriage with a Russian woman.'

For scenarios 3 and 4 with contrastive focus on verbal privative adjective *byvšij* 'former', and the nominal privative adjective *iskusstvennie* 'fake', the consultant found that in both cases, the adjective can be extracted.

4.3.4 *QII Observation*

As with QI, the Russian and BCS speakers were more likely to accept LBE tokens in any scenario whereas the Czech speaker was less likely to accept LBE at all. More importantly, there was no demonstrable difference in acceptance for nominal over verbal types of privative adjectives. This finding does not preclude some variation in the extractability of nominal versus verbal adjectives under different focus or pragmatic situations, but it did not show a difference for these speakers in these situations that demonstrated LBE with modifiers extracted under specificational and contrastive focus.

4.4 Concerning QIII: All Adjective Types, Three Types of Focus, and Emotivity

QIII's purpose was to query speakers on the acceptability of both focus and adjective categorial type, but to do so by testing samples of each possible combination of adjective + focus. The factor of emotivity was another feature mentioned by respondents to the first two questionnaires. However, it was difficult to incorporate emotivity into the adjective + focus type design. As a result, scenarios featuring emotivity were added separately. This led to a very lengthy questionnaire (Appendix E). The discussion in drafting QIII, however, pointed to the variation in acceptability across the three languages as an important issue for the questionnaire design. LBE, according to Bošković 2005 and 2016, is a syntactic possibility in Slavic due to the lack of articles and thus a corresponding lack of DP structure. LBE should therefore occur similarly in all article-less Slavic languages. From this premise, the assumption was made that the basic content and token design for QI and QII could be identical for all three languages studied. However, as demonstrated by the responses to QI and QII, uniform tokens did not create uniform responses across languages. Creating yet a third questionnaire that was the same

for all three languages would likely have resulted in another set of response data that varied by language. The decision was therefore made to use the draft of QIII as a springboard to create more language-specific questions for QIV.

4.5 Responses from QIV: Intersective Adjectives, Specificational, Corrective and Contrastive Focus, and Emotivity

For QIV (Appendix F), language-specific versions of QIV were developed using an intersective adjective in all tokens. QIV tested for LBE under conditions of specificational, corrective, and contrastive focus as well as emotivity. Each language's version of QIV differed, incorporating features suggested by the results to QI and QII as well as the conversations with the consultants. The various versions of QIV were distributed to a smaller population of speakers (3-5 each) with the Russian and Czech questionnaire respondents recruited by the consultants and the BCS respondents recruited again through the *Kako biste VI rekli?* Facebook group.

4.5.1 QIV BCS

Consultation

For all of the scenarios for QIV, the initial consultant evaluated the tokens as acceptable. She showed no specific preference for the emotive over the non-emotive versions. For Scenarios Ia/b and IIIa/b (identificational and contrastive focus respectively) she added the phrase “in the end” to the token, as in “In the end, she wore the green dress.” She did not offer this edit for the tokens in Scenarios IIa/b (corrective focus). She made no further commentary other than to note that she really didn't sense a difference in acceptability among all the scenarios. At that point however, she was no longer available to help and another BCS speaker was recruited. This new consultant was a male, also from Novi Sad who was able to discuss QIV over a Zoom meeting. The

consultant returned a draft of QIV with comments. As was expected, because the tokens were based on Bošković's (2005, 2015) theory, the second BCS consultant overall accepted the LBE forms while marking several of them as acceptable but "sound strange". He felt that the most common response for Ia (specificational, neutral) would just be a one-worded answer with the adjective alone. We adjusted the questionnaire to provide that as a token but to also ask the respondents to identify what the underlying, unabbreviated sentence would look like. When presented with the token, along with this question if they didn't accept the one-word answer, they were similarly asked to provide their opinion of the most natural way of expressing a response to the scenario. For Scenario IIb (specificational, emotive), respondents were given a choice between accepting the LBE variant or rejecting it, and at the same time were asked to provide their own sentence. For the remaining scenarios, the original three choices were provided: 1. "Yes, I would say this", 2. "I could say this but it sounds strange", and 3. "No, I would not use this sentence with this scenario". If they chose the third option, they were asked to give a sentence that they believed would best fit the scenario.

The second consultant felt that the scenarios that were meant to elicit emotive responses could also include more linguistic signals than just the fronted adjective. For example, he suggested adding an exclamation point to the LBE token for Scenario Ib (specificational, emotive), and starting the token for Scenario IIb (corrective, emotive) with an emphatic *ne ne* 'no, no'. For the token for Scenario IIIb (contrastive, emotive), he said it would make the most sense if the emotion expressed were disappointment as opposed to any other sentiment. His suggestion was to somehow express this by adding a phrase that would mean something like "Don't ask me about it" before the LBE'd token.

Only the exclamation point was added for the token for Scenario IIb, whereas the remainder of the questionnaire was kept intact without further amendment.

Results

Three people responded to Questionnaire IV when it was posted to the *Kako biste VI rekli?* Facebook group, two women and one man aged 22 – 48 (see Appendix I). All three felt the single-word adjective answer was perfectly acceptable. When asked to provide the underlying sentence, two of the three speakers placed the adjective and noun at the beginning of the phrase but none of them provided a response with an LBE'd adjective structure. None of the three accepted the LBE token for the emotive version of the scenario (Ib), although one of the respondents (#2) said that if the choice of “I could say this but it sounds strange” had been an option as a response to this scenario, she would have preferred that one. This respondent gave three examples of what she considered would be the most natural responses to Scenario IIb using all caps to indicate what she identified as the *pridev pod fokusom* ‘adjective under focus’ although the term ‘focus’ is never used in the questionnaire text. While her examples show the adjective in different positions within the sentence, none of them demonstrate LBE.

(18) Respondent #2's Suggestions for QIV, Scenario IIa: Emotive for Corrective Focus (no LBE)

- a. Nosila je ZELENU haljinu
 wear.S.F.PST AUX green.F.ACC dress.F.ACC
 ‘She wore the GREEN dress.’
- b. ZELENU haljinu je nosila
 green.F.ACC dress.F.ACC AUX wear.S.F.PST
 ‘It was the GREEN dress she wore.’
- c. Ma onu ZELENU haljinu je nosila
 PART that.F.ACC green.F.ACC dress.F.ACC AUX wear.S.F.PST
 ‘Well, it’s that GREEN dress that she wore.’

For Scenario IIa, all three respondents said they could say the LBE token but that it would “sound strange”. All three of the respondents gave the sentence in (19) as their preferred response.

(19) Zelenu halijnu je nosila
 green.F.ACC dress.F.ACC AUX wore.F
 ‘She wore the green dress.’

Respondent #2, who had offered the various examples for Ib, added as well a variation with the verb in the first position, the auxiliary next and then the adjective and noun but with the adjective under intonational stress (18a). For Scenario IIb, respondents #1 and #3 indicated that they could use the LBE token but that it would “sound off”. Respondent #2 accepted the LBE form but at the same time, as with the other two respondents, provided as her preferred response, the same word ordering as seen in (19).

All three respondents considered the LBE token for Scenario IIIa (contrastive, neutral) as marginally acceptable (“I would say it but it sounds strange”). Similarly, respondents #1 and #3 thought the LBE token for IIIb (contrastive, emotive) was only marginally acceptable whereas respondent #2 rejected the LBE token. Interestingly, for both IIIa and IIIb, respondents #1 and #3 flipped the word ordering from the first four scenarios (19) and instead gave what is given in (20) as their preferred responses.

(20) nosila je zelenu halijnu
 wore.F AUX green.F.ACC dress.F.ACC
 ‘She wore the green dress.’

Respondent #2’s preferred sentence for both IIIa and IIIb was the following, also without LBE.

(21) ipak je obukla zelenu halijnu

however AUX put on.F green.F.ACC dress.F.ACC
 ‘However, she wore the green dress.’

4.5.2 *QIV Czech*

Consultation

The same basic version of QIV was presented to the Czech consultant with the three possible responses: 1. “Yes, I could use this in a sentence in this scenario”, 2. “I could use it, but it sounds strange”, and 3. “I would not use this sentence in this scenario”. In her first response to the questionnaire, the Czech consultant answered as follows:

I can predict that all these sentences would probably get “3” on your scale. The problem is in the verb, standing between the adjective and the noun it modifies. For that reason, it would help to finish your sentences with the verb and skip the noun completely.

For example in your scenario 1a, your example reply would be (in English):
 green + she wore.

For the revision to QIV for the Czech respondents, a mix with and without the noun was incorporated into the tokens, as well as the inclusion of the demonstrative in front of the adjective, as was suggested by both the quantitative data for QI and the consultant responses. As a result, two versions of QIV were made. For QIVa, the tokens for scenarios Ia, Ib, IIIa, and IIIb included the demonstrative, and scenarios Ia and Ib also omitted the noun. In addition, the respondents were asked to provide a full sentence (with nothing elided) if they accepted the token (Appendix I). For version QIVb, all of the scenarios omitted the noun, and scenarios Ia, Ib, IIIa, and IIIb included the demonstrative (Appendix I).

Results QIVa

Three people, all women, two in their 30s and one 60 year old, responded to QIVa. For Ia (specificational, neutral), where a demonstrative was included but the noun was omitted, respondents #1 and #3 answered that the token was acceptable, whereas respondent #2 rejected it. For the “full sentence” for Scenario Ia, even though the accepted token showed the adjective fronted, both respondents #1 and #3 provided full sentences with the adjective and the noun following the verb. When asked to provide the most “natural” wording for a response to Scenario Ia, respondent #1 gave a version of the sentence with the adjective and the noun after the verb, respondent #2 provided just the demonstrative and adjective in the accusative, and respondent #3 fronted the entire accusative object (i.e., the ‘demonstrative + adjective + noun’ string). For Scenario Ib (specificational, emotive), all three respondents accepted the token (with the demonstrative and the adjective fronted and with no in-situ noun). Again, for their preferred responses, respondents #2 and #3 fronted the accusative object, while respondent #1 did not. Respondent #1 added a coordinating phrase in her answer as in (22), converting the response into one that is more indicative of involving contrastive focus.

- (22) Vzala si ty zelené, ale mně se
 took.F REFL these.PL.ACC green.PL.ACC, but me.DAT REFL
 nelíbily a nesluší jí
 disliked.PL.ACC and did not suit.PL her.ACC
 ‘She took the green ones, but I disliked them as they didn’t suit her.’

Scenario IIa (corrective, neutral) for QIVa left off the demonstrative but included the noun. Respondents #1 and #3 indicated that they could use the phrase but that it would sound strange. Respondent #2 rejected it. For their preferred responses, both

respondents #1 and #2 added the word *ne* ‘no’ to the beginning of the sentence, kept the adjective and the noun together and didn’t front the object phrase. Respondent #1 again added a coordinating phrase, emphasizing contrast. Respondent #2 fronted the noun, *šaty* ‘dress’ but left the adjective in situ as shown in (23).

- (23) Šaty měla zelené
 dress.M.ACC had on.F green.M.ACC
 ‘The dress she had on was green.’

For Scenario IIb (corrective, emotive), respondents #1 and #2 rejected the LBE token and respondent #2 said she might say it but that it “sounded strange”. All three gave preferred responses with the adjective and the noun after the verb.

All three respondents rejected the LBE token for scenario IIIa (contrastive, neutral). For their preferred responses, respondent #1 added the word *ne* ‘no’ to the beginning of her sentence, but all three gave sentences without fronting the adjective or the noun. Respondent #2 left the noun off altogether. For scenario IIIb, respondent #1 said she might say it, but that it sounded strange, whereas both respondents #2 and #3 rejected it. All three gave preferred responses with the adjective and the noun in situ after the verb. The constituent orders for respondent-provided tokens for QIVa are summarized in Table 5.

Table 4.5 Czech Composition of Respondent-provided Tokens for QIVa

	#1	#2	#3
Ia: Neutral Specificational	V + [DEM + Adj + N].ACC	No response	V + [DEM + Adj + N].ACC
Ib: Emotive Specificational	V + [DEM + Adj + N].ACC	[DEM + Adj].ACC	[DEM + Adj].ACC + V
IIa: Neutral Corrective	V + Adj.ACC	V + [Adj + N].ACC	N.ACC + V + Adj.ACC
IIb: Emotive Corrective	[Adj + N].ACC	Adj.ACC	V + [Adj + N].ACC
IIIa: Neutral Contrastive	V + [DEM + Adj + N].ACC	V + [DEM + Adj].ACC	V + [DEM + Adj + N].ACC
IIIb: Emotive Contrastive	V + [DEM + Adj + N].ACC	V + [DEM + Adj + N].ACC	V + [Adj + N].ACC

Results for QIVb

Five people, four women and one man, two in their 30s, two in their 40s and one 16 year old, responded to QIVb. For version QIVb, all of the scenarios omitted the noun, and scenarios Ia, Ib, IIIa, and IIIb included the demonstrative. Even without the noun, the answers to IIa and IIb were similar to those for QIVa with IIa (neutral corrective) receiving a mixed response and IIb (emotive corrective) mostly rejected. All but one person rejected the token for IIIb (emotive contrastive) and two of the five rejected the token for IIIa (neutral contrastive). If, at the very least, contrastive focus is said to motivate LBE (Bošković 2005), that does not appear to be the case for Czech. The constituent order for the respondent-provided tokens for QIVb are summarized in Table 6 (see Appendix I for the full tokens).

Table 4.6 Czech Composition of Respondent-provided Tokens for QIVb

	#1	#2	#3	#4	#5

IIIb: Emotive Contrastive	V + [DEM + Adj].ACC	V + Adj.ACC	V + [DEM + Adj].ACC	V + [DEM + Adj + N].ACC	V + Adj.ACC

4.5.4 QIV Russian

Consultation

The Russian consultant was asked to look at the scenarios in QIV (1st version) and provide feedback. In his first response, he indicated that all of the tokens sounded perfectly fine in the scenario contexts given. His only other comment at the time was a note made on the questionnaire for Scenario Ia (identificational focus – neutral response). For this he noted that the token would sound better if reworded.

The original token

(24) The original token for Scenario Ia

Zelenoe ona nosila plat'e
green.N.ACC she wore.F dress.N.ACC
'She wore the green dress.'

(25) The consultant's suggested version for Scenario Ia

Zelenoe ona rešila nosit'
green.N.ACC she decided.F to wear
'She decided to wear the green one.'

He presented this option as providing a more suitable choice of verbs but didn't seem to be aware that he had also elided the noun. He was asked where he thought the noun *plat'e* 'dress' would be placed in the sentence, if it hadn't been elided. He answered that the

noun could be placed anywhere in the sentence, but that it would be “best” right after the adjective.

In addition, the consultant was asked to confirm his statement that there is no difference in meaning if the adjective is fronted or even placed elsewhere in the sentence. He insisted that the meaning did not change, and continued by stating that for Russian, the intonation used is more important for changing meaning. He allowed that the ease with which two words can be pronounced in succession was also a reason for determining word ordering in general. However, he gave the following examples.

- (26) Plat'e Maša včera kupila zelenoe
 dress.N.ACC Masha.NOM yesterday bought green.N.ACC
 ‘The dress Masha bought yesterday is green!’

According to the consultant, this ordering would more strongly express an attitude toward Masha’s stupidity in her purchase, as opposed to (27).

- (27) Zelenoe plat'e včera kupila Maša
 green.N.ACC dress.N.ACC yesterday bought Masha.NOM
 ‘Masha bought a green dress yesterday.’

When asked if there were a specific ordering that would be more likely to be used to indicate irritation, he replied:

Now that I’ve thought about it a bit, the word order might of course depend on what and with whom I am speaking. An adult or a child, a man or a woman, a young or an old person, someone well-known or someone who is a stranger to me. A lot depends on the concrete situation. The more informal and personal the dialog, the freer the word ordering. In a conversation with a close friend I can complain like this about Masha’s green dress:

- (28) Kupila včera plat'e Maša zelenoe...
 Bought yesterday dress.N.ACC Masha.NOM green.N.ACC
 ‘Masha bought a green dress yesterday...’

and he will understand me and not notice anything strange, but consider it a completely naturally ordered sentence.

In this sense, the Russian response was more clearly in support of discourse-related ordering engendering LBE, than treating LBE as a specific left-periphery targeting movement. For Scenarios IIIa and IIIb, a different approach was suggested by the consultant, allowing the respondents to select the constituent ordering. For the neutral context scenario (IIIa), he suggested (29).

(29) A woman named Tanya went to a party in a green dress. Your friend asked you which dress she wore. Please place the following words in the order that you think gives a statement that best shows the expression of objective information:

1. Tanja.NOM
2. green.LOC
3. was
4. dress.LOC
5. in

For scenario IIIb, he suggested (30).

(30) For some reason you very much dislike it that this woman Tanya came to the party in a green dress. You comment on this with indignation to your friend. Please place the following words in the order that you think gives a statement that maximally and fully expresses your indignation:

1. Tanja.NOM
2. green.ACC
3. wore
4. dress.ACC

The consultant pointed out that people could then define for themselves the word ordering that would best express emotivity and that may yield the sought-after LBE'd forms. The final version of QIV included this suggestion (Appendix F).

Results

Only seven people were surveyed using this version of the questionnaire. All of the respondents were men over the age of 60. For scenario Ia (specificational focus, neutral), all but one said that a one-word answer would be the most natural, spoken-word response to the scenario. Even so, when asked to provide a preferred response, only two of the respondents gave one-word answers with just the adjective. Only one respondent agreed that the LBE token would be an acceptable response. That respondent also replied with a fronted adjective when giving his preferred sentence. That response elided the noun. To see this, consider (31).

- (31) Zelenoe ja kupila
 green.N.ACC I bought.F
 ‘I bought the green one.’

Scenario Ib (specificational focus, emotive), however, was more likely to receive a response showing the LBE’d token as acceptable. Four out of the seven respondents accepted it. For their suggested responses, even one of the two who said they’d prefer a one-word answer nonetheless provided a full sentence with the adjective and the noun placed after the verb. Despite their responses to the token, none of them provided an LBE sentence as their preferred responses, and five of them gave responses with the noun elided.

For scenario IIa (corrective, neutral), two of the seven people did not respond to the token but did give preferred responses, one with the whole prepositional phrase (32) and one with just the preposition and adjective but no noun (33).

- (32) V zelenom ona byla plat’e
 in green.PREP she is.F.PST dress.PREP

‘She was in a green dress.’

- (33) Net! V zelenom
no in green.PREP
‘No! (she was) In the green (one).’

Neither gave full sentences with verbs in their suggested preferred answers. Four of the respondents accepted the LBE’d token, but three of them did not provide an LBE version in their preferred response sentences. Of the seven sentences provided by the respondents, four of them elided the noun altogether. One of the respondents did give the LBE’d form as his preferred response as given in (34). He gave it for both IIa and IIb (i.e. neutral versus emotive did not appear to influence his selection). These represented the only occurrences of an LBE’d token in all of the respondent-provided sentences.

- (34) V zelenom ona byla plat’e
in green.N.PREP she was.F dress.N.PREP
‘She was in a green dress.’

For IIb, six of the seven respondents indicated that the LBE token was acceptable for corrective focus with emotive meaning. The seventh respondent did not give a response. Three of the seven gave preferred responses with the noun elided, three with the full NP without the adjective extracted and, as mentioned, one person provided an LBE’d response.

For scenario IIIa (contrastive focus, neutral), none of the respondents ordered the sentence elements to give an LBE’d version. Their responses varied however, with three of them giving a subject + verb + adjective + noun ordering, two giving a subject + adjective + noun + verb ordering and one giving adjective + noun + verb + subject. For IIIb (contrastive focus, emotive), all seven respondents gave the same ordering: subject +

verb + preposition + adjective + noun. Even though the Russian consultant had remarked that emotivity may play a role in constituent reordering in Russian, there was nothing to show a link between emotivity and a preference for a fronted, focused adjective.

CHAPTER V

ANALYSIS

5.1 Introduction

In Bošković's (2005, 2016) view, adjective extraction from an NP requires a clear, direct path for the adjective to move to the phase edge, both to take advantage of the phase edge for extraction and to not violate the Minimal Link Condition. From the syntactic-semantic point of view, the basic structure of DP can be considered more complex, involving several possible FPs above NP but still within DP. Such FPs are emergent, meaning that the roles they play (e.g., hosting a modifier with possessive features, or a modifier with sortal features) are based on both the modifier used and its meaning within the utterance. That is to say, those FPs only emerge within the structure, when the utterance uses them; otherwise they may not be projected (Kim 2019). Within a specific utterance, different FPs may emerge as needed. The kind of structure that Bošković has is more rigid and unlikely to be contingent upon variable discourse contexts. So, for a sentence with a single, intersective adjective extracted, like Bošković's (2005) one in (1):

- (1) Lijepe_i je video t_i kuće
 beautiful.F.PL.ACC_i AUX.3SG saw.M.3SG t_i houses.F.PL.ACC
 'He saw BEAUTIFUL houses.'

the structure of the underlying nominal phrase can be seen as always composed of the same, basic constituents, irrespective of the discourse context in which it is uttered. For this particular utterance, the structure can be seen as comprised of only its extracted element (*lijepe*) in a CP-level FocP, the VP, and the space within the NP where the N (*kuće*) and the AdjP's trace remain. This could mean, under Bošković's (2005, 2016) view, that the AdjP simply had an unobstructed path (e.g., no DP and phrasal movement

that does not violate minimality) to a position where it can extract first from the nominal phrase and then from the VP in order to move up to the FocP position at the CP level. Alternatively, the utterance can be seen as having an underlying complex structure with a discourse-contingent FP that emerges within DP to attract (through EPP) a focused element to a position at the edge of DP, which is itself phasal (Rappaport 2000). This latter view is consistent with analyses of nominal structure that specifically address modifier behavior, including focus movement, within an expanded DP structure (e.g., Kim 2019, or Rappaport 2000).

Longobardi (1994) sees DP as not only a syntactic position for determiners, but also a functional category that encodes definiteness and referentiality. The higher up in the nominal structure (i.e., the closer to the D head), the more likely that a moved element is expressing something discourse-linked (D-linked). This meaning can be definiteness or uniqueness in the familiar sense we use in English when using the article *the* or it can mean that the element occupying this higher position presupposes a discourse situation which provides context for the element's interpretation. As Rizzi (1997) notes, elements that end up at the left periphery of a clause have a “dual function”; they satisfy both the clause-internal needs of syntax through feature matching and discourse-facing requirements by specifying whether they represent questions, or focused or topicalized elements. Items at the left-periphery should therefore be investigated in terms of their role as an interface between syntax and pragmatics. If, as Bošković (2005, 2016) asserts, BCS is a “focus-movement” language and that LBE is, at least in some instances, focus movement, then LBE should be seen as taking place within a structure that accounts for the D-linked nature of focus movement.

5.2 Discourse Context and Expanded DP

From the results in this study, there were several aspects of the research findings that point toward discourse context as the decisive element in LBE. The consultants commented that tokens with an extracted, fronted AdjP seemed more acceptable if the speaker was expressing some kind of judgment about the trait represented by the adjective. Discourse effects can have an influence on LBE that can be surmised by how difficult it was to discover contexts where respondents could judge LBE'd forms as grammatical. Czech respondents rejected LBE tokens with rates up to 80% for all types of adjectives except intersective ones in QI. Russians, while more accepting than Czechs, also showed lower levels of acceptance overall (10%-35%) than did the BCS speakers (15%-45%). This suggests that even though LBE is widely attested, lightly contextualized tokens aren't always acceptable. In fact, they appear to be often unacceptable, even under conditions of focus where one would expect to find them.

Such findings suggest that speaker effect plays a role in LBE. Expanded DP analyses (e.g., Laenzlinger 2005, Svenonius 2008, Kim 2019) have the potential to address the interface between discourse (which includes the context for speaker effect) and syntax by defining the different functional roles that adjectival modifiers may play. As such, expanded DP analyses are more adequate for situating the data found in the present study. The discourse factors identified by respondents in connection with the categorial nature of the attributive adjectives used in the questionnaires points to there being some limitation on extraction that may be attributed to the categorial type of the attributive modifiers. This preliminary finding means that we should take a closer look at

both adjectival semantics and theories of nominal structure which may account for their behavior.

5.3 Complex DP

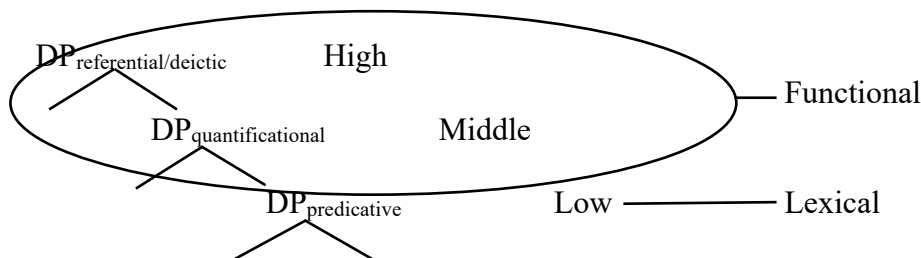

In her 2019 book *The Syntax and Semantics of Noun Modifiers and the Theory of Universal Grammar*, Kim turns to Cinque (2010) and Larson (1998, 2000) to build out a complex nominal structure inclusive of several layers of FPs above NP. This she does to take into account the syntactic behavior of relative clauses in Korean as well as adjective ordering phenomena in other languages such as Spanish, French, and Italian. Kim theorizes that restrictions on the ordering of modifiers is partly due to their not having uniform semantics. In addition, she uses Laenzlinger's (2005) internal/external split of DP space into a lower area where lexical meaning arises, and the cartographically higher position where functional meaning arises, to allow a more Rizzian (Rizzi 1997) semantics to become part of the rationale for hierarchical orders for modifiers. Ultimately, Kim settles on three, DP-internal spaces with three kinds of meaning related to the space in which the modifiers arise or merge.

According to Kim, adnominal meaning structure can be divided into *restrictive* and *non-restrictive*. *Restrictive* refers to modifier meaning that restricts what the head N denotes (*reference-modifying* in the sense of Bolinger (1967)) whereas “non-restrictive” meaning is the sense created when the modifier applies to the DP as a whole (*referent-modifying* in the sense of Bolinger (1967)). *Restrictive* meaning restricts what is denoted by a common noun phrase (CNP) such as *student* and *dress*, whereas *non-restrictive* meaning applies to an individual that is already introduced into the discourse. In this sense, non-restrictive meaning is more likely to be deictic or referential. Kim points out

that it is Laenzlinger (2005) who links these modes of sense-making to the merge positions of modifiers within DP structure. In Kim's theory, non-restrictive meaning is created by modifiers that merge at a higher position than a pre-existing Spec of DP.

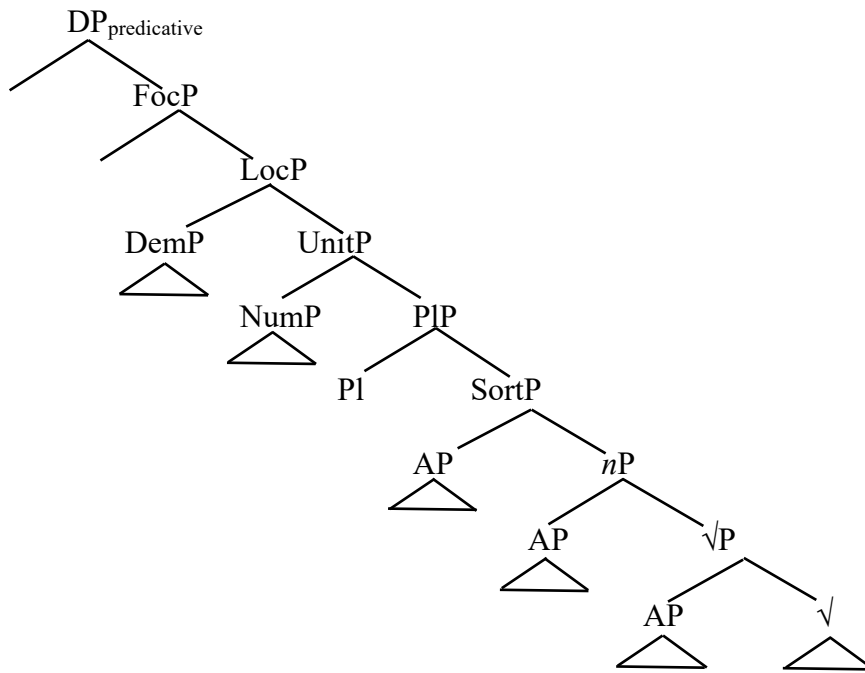

Making a one-to-one mapping between the syntactic position of a noun modifier and its semantics can, according to Kim, account for the relative modifier positions seen in adjective ordering restrictions (AORs) even in languages said to have free constituent ordering. Calling on a Split-DP model, she uses previous models of nominal structure to distinguish first external and internal DP space and then to subdivide the internal space into three areas, i.e., what she calls *High Field*, *Middle Field*, and *Low Field*, with lexical meaning emerging in the *Low Field* and functional meaning assigned in the *Middle* and *High Fields*. Within each field, there is a different denotational type of DP: predicative nominals are of type $\langle et \rangle$ arising in the *Low Field*, quantificational nominals are of type $\langle \langle et \rangle t \rangle$ and arise in the *Middle Field*, and referential/deictic nominals are of type $\langle e \rangle$ and are formed in the *High Field*. Hierarchically, $DP_{\text{predicative}}$ is the base level, above which is the $DP_{\text{quantificational}}$ level, and the topmost level is $DP_{\text{referential/deictic}}$.

Figure 5.1 Three fields within DP (Kim 2019:132)

Within the Low Field, there is a hierarchy of possible functional projections that define how attributive adjectives are ordered (see Kim 2019, Ch. 4). Summarized, these

are (from lowest to highest): $\sqrt{P}$ (root phrase where compounds and idiomatic expressions are generated), nP , SortP, PlP (Plural Phrase), UnitP, LocP, and her FocP. These categories are posited based on typological studies such as Greenberg 1965, Rijkhoff 2002, Scott 2002, Borer 2005, and Svenonius 2008. Under Kim's hierarchy, different N modifiers occur in different Spec positions. For instance, a DemP (when it does not function as an article) occurs at [Spec, LocP]; a gradable, subsective AdjP merges at [Spec, SortP]; and a non-gradable intersective AdjP merges at [Spec, nP] (Kim 2019:105). The proposed full Split-DP structure posits DemP starting out in the [Spec, LocP] position, NumP in the [Spec, UnitP] position, and different feature-checking APs occurring in [Spec, SortP] and [Spec, nP] among others, as shown in Figure 5.2.

Figure 5.2 Lower Field/ $DP_{\text{predicative}}$ (Kim 2019:132)

In this framework, what determines which types of modifier a nominal has depends on from which Spec position and within which DP field they have merged. For example, nominal modifiers that aren't denotationally part of a referential or quantificational nominal merge somewhere within $DP_{\text{predicative}}$. For the issues at stake in nominal structure for Slavic, the leftward movement through the FPs within DP is conceivably the route taken by an LBE'd attributive adjective. The LBE'd modifier likely arises at an FP within $DP_{\text{predicative}}$, and then moves up to $DP_{\text{referential/deictic}}$ under the influence of focus to the position where the PIC would be operative. Such a structure gives a possible account for the way a DemP position affects structure differently in English versus Slavic. In Kim's theory, demonstrative determiners (DEMs) emerge at [Spec, LocP] in the Low Field and then typically move up to $DP_{\text{referential/deictic}}$. However, if there is nothing occupying LocP (e.g., there is no demonstrative or possessive determiner in the nominal), then there is no need for LocP to be projected. This

possibility is covered by Kim with a revision of Dimitrova-Vuchanova and Giusti's (1998) Principle of Economy of Lexical Insertion (PELI) as given in (2) (Kim 2019:128).

(2) A functional projection (FP) that has any syntactic features must be licensed at all levels of representation by:

- a. making the specifier visible (i.e., pronounced) or
- b. making the head visible.

But an FP whose head hosts no syntactic features need not be visible at any level of representation.

Under this theory, if there is a DEM inside a nominal, it can move to $DP_{\text{referential/deictic}}$, but if there is no DEM, then: “in the absence of a definite article, non-restrictive [...] APs may pronounce the $DP_{\text{referential/deictic}}$ if a DEM is not suitable to occur inside the same $DP_{\text{referential/deictic}}$ for some semantic reason” (Kim 2019:129). Therefore, the $DP_{\text{referential/deictic}}$ area in the nominal structure can serve as the merge location for adjectives that convey a specific discourse-related meaning (Kim 2019:137).

5.4 Adjectival Semantics

As outlined previously in Chapter II of this dissertation, Bošković (2005, 2009, 2016) treats all words with adjectival morphology as semantically equivalent. He claims that adjectival semantics is straightforwardly intersective (what he calls “modification”) across the board, with a denotational type of $\langle \text{et} \rangle$. His only exception is demonstratives which he treats as of type $\langle \langle \text{et} \rangle \text{e} \rangle$. According to Bošković (2005), this uniformity of semantic type is what allows any possible ordering of modifiers within article-less Slavic languages. Under free constituent ordering, it is all the same where a nominal modifier surfaces, because as adjoined elements, it always compositionally contributes the same semantics to the NP. There is some merit to his taking this approach to BCS where adjectival morphology does appear to be uniform across attributive adjectives,

possessives, and demonstratives. However, as discussed in Chapter I, there are distinctions in adjectival morphology that are associated with definiteness and sometimes with different, separate declensions (e.g., in Russian and Czech). It is because of these distinctions that Pereltsvaig (2013) and Veselovská (2014) are able to identify some types of modifiers as separate from AdjPs in general and more properly as being part of their own functional projections as DemP, PossP, and NumP, placing them above NP and thus supporting a more complex nominal structure than what is posited by Bošković.

In terms of LBE for the present study, demonstratives and prenominal possessive pronouns did not yield very informative results in the initial questionnaire. As noted (see Chapter III), demonstratives were difficult to create LBE contexts for because when something distal is focused, it becomes something proximal from the point of view of the speaker. So whereas demonstratives do not allow subsequent adjectives to extract past them, it was difficult to create a clear context in a written format for extracting just the demonstrative unless the noun was also elided (see Chapter IV). LBE'd possessive pronouns (with the exception of BCS) were also uniformly rejected by respondents. The bulk of the subsequent data, therefore, concentrated on the behavior of attributive adjectives.

In the data collected, LBE tokens using modal adjectives showed the least acceptance (16.7% of respondents). For Russian, discounting the subsecutive,¹² the lowest

¹² Many respondents complained that the token's verb *predpočítat* 'prefer' sounded wrong when used with an animate direct object, even though the native speaker who helped develop the QI thought it was acceptable. The questionnaire was not re-distributed with a different, more suitable verb.

acceptance percentage was also for the modal ('alleged'), at 10%. For Czech, the modal showed roughly the same level of rejection as all the other adjectives save the intersective. Also for the Russian and BCS, the two overall most accepted LBE tokens among the straightforwardly attributive adjectives used were the intersective meaning 'green' and the nominal privative meaning 'fake' (see Appendix B). Even for the Czech, which overall showed little acceptance for LBE'd attributive adjectives, the intersective token showed slightly more people willing to call that form grammatical with an acceptance rate of 10%. According to Partee's (1987) basic definition, adjectives give the meaning (semantic value) of the CNP they modify to the overall meaning of the ADJ + CNP combination. The subcategory that most straightforwardly expresses this "intersective" semantic value was the category most accepted for extraction in the data gathered in this study. Within a Split-DP model, such intersective modifiers may emerge in the low, $DP_{\text{predicative}}$ field where they contribute their lexical meaning, but they move up to $DP_{\text{deictic/referential}}$ or even beyond the DP projection in order to express a discourse-related meaning.

5.5 Focus/Topicalization/Speaker Effect

5.5.1 Focus

The first assumption in the study, along with the decision to divide adjectives by category, was that LBE is likely to represent focus movement in the three languages studied. However, not all of the languages appear to equally permit LBE in focus environments. The present study's consultations and questionnaire results suggest a more complicated picture that varies by each Slavic language. In terms of focus, the original QI did not compare different types of focus movement (e.g., contrastive, specificational,

corrective) so it isn't clear if using only one type of focus accounted for the mixed responses from the Russians and the overwhelming rejection by the Czechs. If LBE represents a type of syntactic focus movement available to all article-less Slavic languages, then the expectation would have been that specificationally focused modifiers would be judged grammatical in all these languages. BCS showed the highest acceptance rate for specificationally focused LBE (QI), but, overall, respondents for all three languages did not show particular preference for LBE under specificational focus. While the respondents and consultants did make comments about speaker effect, the overall findings from the three questionnaires suggest that while there may be a left-periphery D-linked process at play in LBE, it is not necessarily focus or it is a process sometimes inclusive of focus depending on the discourse context.

In this study, QII used only privative adjectives but compared specificational and contrastive focus. Again, there was no discernable preference for either type of focus. And finally, concentrating solely on the extraction of an intersective adjective (e.g., the adjective meaning 'green' used in the questionnaires), based on the findings from Questionnaire I that such Adjs are most readily LBE-moveable in all three languages, QIV kept focus as the basic principle underlying the movement, and provided three different types of focus (specificational, corrective, and contrastive). At the same time, in QIV, the variable of speaker effect or emotive content was introduced. Whereas specificational focus as defined by Kiss (1998, 2017) was expected to be the most likely context for LBE, focus (of any type) with the addition of speaker effect did tend to be a slightly more acceptable context for LBE than focus alone (in relatively neutral contexts),

thus supporting the view that there is a D-linked factor, inclusive of focus, that affects LBE acceptability.

5.5.2 *Topicalization*

If focus alone does not seem to give adequate context for acceptable LBE forms, one possible approach to the problem of defining LBE context may be inherent in the terminological variation noted for Russian scholarship on *theme* and *rheme*. Specifically, the issue may relate to how the movement behavior that Rizzi (1997) and Kiss (1998, 2012) identify as “focus” (operator-initiated movement to the left periphery with an exhaustive interpretation) is labeled. Although the extracted modifiers are likely checking a focus feature, perhaps neither “focus” nor “topicalization” are adequate terms in that they do not capture both the idea of focalization and the more explicitly discourse-linked element of emotivity that seems to be at work in LBE. In support of loosening the terminology here, consider Kim’s (2019) observation that APs that are interpreted as non-generic can stay in DP_{predicative}, but the entire DP has to project to the external level(s) (i.e. DP_{quantitative} or up to DP_{deictic/referential}). Kim places FocP just under DP (whichever one is the highest projection for that phrase, deictic/referential, quantificational, or predicative) but above where DemP emerges in [Spec, LocP]. In Bošković (2005, 2016) LBE’d adjectives receive a focus interpretation although the discourse context isn’t given, so their status in terms of [+/- deictic/referential] isn’t clear in his analysis. If we consider the fact that LBE’d modifiers need to be at a phase edge to extract, then they likely have to also get to [Spec, DP_{deictic/referential}] in a Split-DP model, in order for extraction to be possible. The expectation is that a contextual analysis would show that LBE’d phrases are necessarily [+deictic/referential] as well.

For all of the scenarios tested in QI, QII and QIV, the quality described by the Adj that undergoes movement is *non-restrictive* (as Kim 2019 defines the term) in the token sentence because the quality is already salient in the discourse as demonstrated by its use in the scenario setting up the sample token. For example, in Scenario I in QI (Appendix A), the discourse context is a group of women considering three dresses whose colors are known to them: red, green, and black. This scenario creates a context for the token wherein out of all possible dresses in the world, the person being spoken to knows there is a specific red dress, a specific green dress, and a specific black dress that are under consideration. This knowledge creates a presupposition by defining for the interlocutors a finite subset of all relevant dresses. Hypothetically, picking out one of those dresses (i.e. specifying a specific member of the set) is syntactically equivalent to moving (a part of) the relevant nominal constituent to the DP_{deictic/referential} area. Moving just the attributive adjective such as an equivalent to ‘green’ in English to the extra phrasal position (through extraction to the CP) further emphasizes the attribute it represents in ways that letting it stay in situ would not. Deciding whether this emphasis constitutes focus or topic, however, is not so clear.

Overall, distinguishing focus and topic positions at the left periphery is difficult and is not illuminated either by the scenarios in this study or by the respondent answers. For instance, in the Russian version of QIV, most of the sentences that the respondents provided as ‘most natural’ either leave the adjective with the noun phrase after the verb, i.e., at the end of the sentence in the typical spot for Russian focused elements, e.g., examples (3b), (3c), and (4c) below, or they kept the adjective in situ but elided the noun

as in (3f), (4a), and (4f). Alternatively, if they do front the adjective, they elide the noun as in (3a) and (4e) or the entire VP as in (3d), (3e), (3g), (4d), and (4g).

(3) Respondent-provided sentences for QIV, Scenario Ia: Neutral for Specificational Focus

- a. Zelenoe ja kupila
green.N.ACC I buy.F.PST
'I bought a green (one).'
- b. Ja kupila zelenoe plat'e
I buy.F.PST green.N.ACC dress.N.ACC
'I bought a green dress.'
- c. Ja vybrala zelenoe plat'e
I choose.F.PST green.N.ACC dress.N.ACC
'I chose a green dress.'
- d. Zelenoe
green.N.ACC
'The green one'
- e. Zelenoe plat'e
green.N.ACC dress.N.ACC'
'(I bought) The green (one).'
- f. Vybrali zelenoe, ego ja i kupila'
choose.PL.PST green.N.ACC it I EMPH buy.F.PST
'They/you picked the green (one), and I bought it.'
- g. Plat'e? Zelenoe!
Dress.N.ACC green.N.ACC
'A dress? (I got) The green (one)!'

(4) Respondent-provided sentences for QIV, Scenario Ib: Emotive for Specificational Focus

- a. Ja kupila zelenoe
I buy.F.PST green.N.ACC
'I bought the green (one).'
- b. *no token given*
- c. Ja predpočla zelenoe plat'e
I prefer.F.PST green.N.ACC dress.N.ACC
'I preferred the green dress.'
- d. Zelenoe
green.N.ACC
'The green (one)'
- e. Zelenoe kupila
green.N.ACC buy.F.PST
'I bought the green.'
- f. Kupila zelenoe
buy.F.PST green.N.ACC

- g. Ty budeš' smejat'sja, no zelenoe!
 You AUX laugh.INF but green.N.ACC
 'You'll laugh, but (I got) the green (one)!'

For BCS, which had the fewest respondents, the only universally rejected LBE token was the one in response to the specificational focus under an emotive context. At the same time, one of the respondents noted that focus stress would best relay the meaning suggested by the scenarios given in (5).

(5) Respondent #2's Suggestions for QIV, Scenario IIa: Emotive for Corrective Focus (no LBE)

- a. Nosila je ZELENU haljinu
 wear.S.F.PST AUX green.F.ACC dress.F.ACC
 'She wore the GREEN dress.'
- b. ZELENU haljinu je nosila
 green.F.ACC dress.F.ACC AUX wear.S.F.PST
 'It was the GREEN dress she wore.'
- c. Ma onu ZELENU haljinu je nosila
 PART that.F.ACC green.F.ACC dress.F.ACC AUX wear.S.F.PST
 'Well, it's that GREEN dress that she wore.'

Overall, the sentences provided by the BCS respondents as the most natural to use with all three types of focus, emotional and neutral, did not tend to show LBE. BCS responses to QIV are summarized in Table 5.1.

Table 5.1 BCS Composition of Respondent-provided Tokens for QIV (bold indicates focus stress)

	Respondent #1	Respondent #2	Respondent #3
Ia: Neutral Specificational	V + [Adj + N].ACC	[Adj + N].ACC + RC	[Adj + N].ACC
Ib: Emotive Specificational	Adj.ACC	V + [Adj + N].ACC [Adj + N].ACC + V Det + [Adj + N].ACC + V	V + [Adj + N].ACC
IIa: Neutral Corrective	[Adj + N].ACC + V	V + [Adj + N].ACC [Adj + N].ACC + V	[Adj + N].ACC + V
IIb: Emotive Corrective	[Adj + N].ACC + V	Adj + N].ACC + V	Adj + N].ACC + V
IIIa: Neutral Contrastive	V + [Adj + N].ACC	V + [Adj + N].ACC	V + [Adj + N].ACC
IIIb: Emotive Contrastive	V + [Adj + N].ACC	V + [Adj + N].ACC	V + [Adj + N].ACC

While limited, this result shows that even in BCS, LBE is not as prevalent as has been claimed in the literature (e.g., Bošković 2005, 2016).

5.5.3 *Speaker Effect*

As noted in Chapter IV, in QI many Russians mentioned that acceptability could increase under different scenarios. The BCS consultant mentioned that acceptability might increase if the context included the notion of “correction”. Perhaps related to this is the frequency of the Russian respondent comments about “irritation”. Whereas the BCS and Russian consultants made mention of emotion related to LBE acceptability (correction and irritation respectively), it proved to be quite difficult to elicit a similar analysis from the Czech consultant, except when she suggested that a fronted adjective, together with a demonstrative would be both acceptable, and also would express annoyance.

(6) Transcript from Discussion with Czech Consultant

Q: Are there any situations or attitudes that could make any of these sentences more acceptable?

A: It would be possible to use the sentences (answers) with this “wrong” word order but only if we put a demonstrative pronoun in front of the object.

For example:

- a. Ty zelené šaty si koupila
 This.F.ACC green.F.ACC dress.F.ACC AUX buy.F.SG.PST
 ‘This is the green dress she bought.’
- b. Tu tvoji knihu potrebuji
 That.F.ACC your.F.ACC book.F.ACC need.1SG
 ‘That is your book I need.’

If the sentence is structured like that, it can:

1. show an annoyance of the speaker - the person who is asking
 the question should already know the answer
2. mean that the speaker wants to emphasize the information
 which comes first in the sentence.

Again, the results obtained in this study suggest that LBE is linked to pragmatic factors related to left-periphery movement, not purely syntactic focus movement.

QIV did yield LBE forms in the respondent-provided tokens for both Russian and BCS (see Table 5.1 above for BCS), although for all scenarios, both neutral and emotive, those LBE forms were comparatively fewer than the tokens with typical V + ADJ + N ordering.

(7) Respondent #5’s LBE tokens from QIV

- a. Scenario IIa: Neutral under Corrective Focus

V zelenom ona byla plat’e
 in green.N.PREP she is.F.PST dress.N.PREP
 ‘It was the green dress she was in.’

- b. Scenario IIb: Emotive under Corrective Focus

V zelenom ona byla plat’e
 in green.N.PREP she is.F.PST dress.N.PREP

‘It was the green dress she was in.’

The BCS respondents, for example, were more likely to say they’d accept LBE forms, but mostly provided non-LBE tokens themselves. The consultant interviews did still suggest that whether an LBE form sounded acceptable or not depended somewhat on the attitude of the speaker toward either the situation, or the person being referred to, and that attitude tended to be described differently (annoyance, irritation, judgment) at different times in the consultant discussions, but was most often negative. From this it is reasonable to conclude that speaker effect does influence grammaticality judgments for LBE forms, perhaps crucially so, but at the same time, none of the instruments developed here were able to adequately isolate which element of context or speaker effect, or which combination of those elements could yield more information about what is a reliable motivator for LBE.

5.6 Discourse Salience

That the moved modifiers in LBE are not only checking [+/- focus] but also the discourse-linked [+/- deictic/referential] feature is suggested by the Czech and Bulgarian data as well as from some of the observations supplied by the consultants and questionnaire respondents about preferred forms. Under conditions of focus, LBE may be one possible tool to express focus along with discourse salience. However, according to this preliminary data, LBE is not expressing focus alone. When an attributive adjective expresses focus and some kind of discourse salience such as emotivity, extraction is one possible option in these article-less languages. It is also possible to express the same meaning without LBE, but rather by eliding all but the focused adjective or just using the focused adjective and a DEM with the remainder of the phrase elided.

As described in Chapter IV, the Czech results for QIV (both a and b) versions, as expected, showed an overall rejection of LBE forms. Even though a demonstrative was added to several tokens, its inclusion did not improve the acceptability of the emotive samples (see Tables I.2 and I.3 in Appendix I). For example, in both versions (a and b) of QIV for Czech, Scenario Ia: Neutral under Specificational Focus, and Scenario Ib: Emotive under Specificational Focus, the same token was provided in the questionnaire as given in (8).

- (8) ty zelené si vzala
 this.F.ACC green.F.ACC AUX take.PST
 ‘She took this green dress.’

The given word ordering was DEM + ADJ + V with no N. Of the eight respondents three accepted the token in a neutral context whereas five did not. Even though several accepted the LBE form, when giving their own sentences, most kept the ADJ and the N together after the V. In the provided sentences, sometimes the respondents answered with either just the ADJ in an oblique case or a PREP + ADJ or DEM + ADJ combination all without the N.

In Czech for QIVa and QIVb, no one accepted the LBE tokens, nor did they give LBE tokens in the sentences they provided themselves. By contrast, the BCS and Russian responses, while accepting LBE, gave few LBE sentences of their own, and only for specificational or corrective focus, but none in contrastive focus. In view of the provided sentences, Czech doesn’t readily extract adjectives under focus conditions. However, in the context of corrective focus with a DEM, several people did find the most natural

response to be the DEM + ADJ combination by itself which suggests an N/NP ellipsis more than LBE.

The Czech responses also compare interestingly with the responses from Bulgarian, a language which, under Bošković's (2005, 2010, 2014, 2016) schema, cannot have LBE because it has DP. In supplying tokens for QI, the Bulgarian respondents overwhelming gave answers with the suffixal definite article (Appendix C).

- (9) a. zelena-ta
green-the
b. visokij-at
tall-the
c. falšivij-at
false-the

Both the Czech respondents and the Bulgarian consultants showed a preference for indicating definiteness in the scenarios given. This is interesting because while Bulgarian cannot use fronting to create the pragmatic effect that LBE does, it can use its articles. Even with the syntactic option of LBE, the Czechs reach for a similar tool to express focus without extraction. Both languages also show some tendency to focus the adjective by using it by itself as a response. This tendency to provide a single-word response (the ADJ in an agreeing case) was also evident in the Russian and BCS responses. This commonality potentially indicates two things:

1. that under conditions of focus, even an article-less Slavic language like Czech may not necessarily use LBE, but may in fact use markers of definiteness (DEMs) or less frequently, will use the ADJ by itself to indicate focus in more or less the same way a Slavic language with articles (Bulgarian) does, and

2. that while LBE may be a way that some languages express focus, its use is perhaps not based on whether the language has articles, or, by extension, has a parameterized DP.

5.7 LBE and Split Nominals

Bošković (2005) expressly rules out a comparison of LBE with split nominals by pointing out that, in BCS, nouns do not extract to the left-periphery. This exclusion comes to light as part of his argument against a *Copy/Delete* explanation for LBE (Ćavar and Faslow 2000). *Copy/Delete* comes about in those cases where an NP is copied and one version is left in situ while the other is fronted, in this case, to the left periphery position. The adjective is deleted inside the original NP and the noun is deleted in the fronted copy (11). This deletion pattern is called “scattered deletion”. This process is demonstrated for BCS in (10) (the original sentence) and (11) (Bošković 2005:13).

- (10) Crveno je on auto kupio
 red.N.ACC AUX he car.N.ACC buy.PST
 ‘He bought the red car.’

- (11) [Crveno ~~auto~~] je on [~~crveno~~ auto] kupio

Bošković notes that scattered deletion is only a “last resort” option that happens at PF. The primary problem with the Copy/Delete analysis in his view, however, is that there is no way to constrain the surface forms that have undergone scattered deletion and one can end up with forms that are ungrammatical in BCS as shown in (12).

- (12) *auto je on crveno kupio
 car.n.ACC AUX he red.N.ACC buy.PST
 Intended: ‘He bought the red car.’

That form would need to come from a process like:

- [~~Crveno~~ auto] je on [crveno ~~auto~~] kupio

Because there is no mechanism in Bošković's syntax that would disallow (12) while still allowing (10), he dismisses Copy/Delete as a viable explanation for LBE. There is also no mechanism to disallow (12) for BCS within an expanded DP with focus/D-linked movement to the phase edge, so this issue is not directly resolved in the present study either. However, in contrast to BCS LBE (and similar to Polish split nominals), such topicalized elements in Russian need not be nominal modifiers, but when modifiers are topicalized in Russian, the end result is structurally identical to LBE as Bošković describes LBE. Russian can topicalize a noun and leave its modifier in situ as shown in (26) in Chapter IV (repeated here as (13)).

- (13) Plat'e Maša včera kupila zelenoe
 dress.N.ACC Masha.NOM yesterday bought.F green.N.ACC
 'The dress Masha bought yesterday was green.'

According to my Russian consultant, (13) shows that the speaker's judgment is that Masha was "stupid" in purchasing that particular dress. Note that here, the rhemic information is "green", and, being the theme, the the nominal meaning "dress" is fronted and interpreted as definite and familiar.

Similarly (although without emotive coloring), the token provided by respondent #3 for the Czech QIVa, Scenario IIa: Neutral under Corrective Focus (in Table 6, Ch. IV) fronts the noun but leaves the adjective in situ. That datum shows a split nominal word order:

- (14) Šaty měla zelené
 dress.F.ACC have.F.PST green.F.ACC
 'The dress she had was green.'

Almost no LBE'd tokens were provided by the respondents in QIV for all three languages, but at the same time, many gave responses with the Adj in situ or fronted, but the noun elided, or just the Adj with no VP. Although not explored in the present study, there may be a possibility that some amount of Bošković's (2005, 2016) tokens are forms reconstructed from the more common Adj-only (15) or fronted-Adj and elided noun constructions (16) of the type given by respondents to QIV.

- (15) [Crveno ~~auto~~]_i je- ~~on~~ t_i ~~kupio~~
 [red.N.ACC ~~car.N.ACC~~]_i AUX he t_i buy.M.PST
 'The red (one)'
- (16) [Crveno ~~auto~~]_i je on t_i kupio
 [red.N.ACC ~~car.N.ACC~~]_i AUX he t_i buy.M.PST
 'It's the red (one) he bought.'

If Bošković examples are reconstructions, it may be that it is the case that instead of LBE, instead perhaps a fronted NP has been elided

If we consider the Czech consultant's proposed tokens in response to Corver's LBE examples, it appears as though ellipsis may account for some of what has been identified as LBE'd forms (see also, discussion in Chapter IV). The variants provided by the consultant clearly show that the entire phrase gets fronted and then in each of the successive versions, another piece of the sentence is elided, ending with just the modifier as shown in (17)-(21).

- (17) Její čte Petr knihu!
 Her reads Peter book.ACC
 'Peter reads her book!'
- (18) Petr čte její knihu!
 Peter reads.3.SG her book.ACC
 'Peter reads her book!'
- (19) Její knihu čte!

her book.ACC read.3.SG
 ‘It is her book he reads!’

- (20) Její knihu!
 her book.ACC
 ‘Her book!’

- (21) Její!
 Hers
 ‘Hers!’

What is missing for the Czech tokens is any LBE form to begin with. Thus, a sentence like (19) is likely not underlyingly an example of an LBE’d form. It is instead a fronted, modified nominal phrase, where the focused modifier is retained while the noun is elided. Each subsequent form given by the consultant clearly suggests this reading. We may thus assume that not all phrases with fronted AdjPs may be LBE, as many elide the noun in any case. The fact that many participants in this study responded with one-word answers, using only the adjective, or they fronted the adjective while eliding the noun makes the status of LBE less clear. Presumably there are cases where it can be demonstrated that the AdjP has extracted from its NP. In such cases, it extracts, leaving the noun in situ. However, it is also worth noting that there may be a parallel process where the entire NP moves to [Spec, DP] first (with [Spec, DP] as a phasal edge) and then the AdjP extracts to [Spec, CP] and the noun is elided. There is also the possibility, using the expanded DP view, that the AdjP may move up to [Spec, DP] by itself in accordance with AORs but under focus or some focus-like operator, as seems to be the case in many of the responses obtained in this, and then it extracts from the DP to [Spec, CP].

CHAPTER VI

CONCLUSION

While preliminary, the most obvious overall interpretation of the findings in this study is that the factor driving acceptability for LBE forms must be context-based and discourse-linked because decontextualized or incorrectly contextualized LBE forms are not accepted by native speakers. The questionnaires were administered to native speakers of BCS, Czech, and Russian. The examples tokens were developed from Bošković (2005, 2009, 2012, 2016) who claims a uniform nominal structure and LBE syntax for Slavic in general. If the forms in the questionnaires and interviews were not initially acceptable, it is most likely that the discourse contexts provided by the scenarios caused the mismatch for speakers in judging grammaticality. The findings from the interviews and pilot questionnaires do suggest some themes that may guide future study. For instance, there were some interesting trends observed: many respondents mentioned the role of emotivity on the part of the person using an LBE form, answers showed a preference for intersective adjective extraction, and responses also indicated a dis-preference for modal adjective extraction. These observations suggest two possible conclusions: 1) that pragmatic context is likely a primary factor in LBE, and 2) that adjectival semantics plays a role in movement and extraction. The first observation has bearing on nominal structure in that extraction to the left periphery is most likely motivated by an operator with features sensitive to the discourse context even if those features are not uniformly recognized as *focus*. The second has bearing on nominal structure in that the relative positioning and movement of adjectives related to their semantics is more thoroughly

covered in a theory of nominal structure where DP is expanded and contains multiple FPs.

Based on the data collected, there is not a clear picture of which specific pragmatic contexts can be said to condition LBE. For example, Q1 was designed to test the semantic type of the adjectives and it did uncover the noted trends concerning intersective and modal adjectives. The various attempts at testing different types of focus were less conclusive. Although the individual responses and interviews indicated that people believe that focus is at play, no one type of structural focus (e.g., specificational, contrastive, or corrective) could be identified as a common factor for LBE. This situation was observed in the questionnaire responses even though most of the reviewed literature on LBE claims that it occurs due to focus movement. Finally, emotivity as a factor in LBE was tested with the final questionnaire. Again, although the respondents frequently mentioned emotivity, the questionnaire designed to elicit emotive responses was also inconclusive as to how emotivity plays a role in LBE. From this, as with focus in general, what we can conclude is that some emotivity is at play, but the instrument designed to test for this was not adequate to the task. None of these approaches produced responses that would indicate that native speakers of Russian, Czech and BCS uniformly accept LBE forms under the conditions the questionnaires were designed to test.

Some other observations that can be made about the process of testing for LBE forms are that: 1) it is very difficult to elicit the form, 2) speaker intuitions about the form were mostly negative, and 3) when forms are judged acceptable, there are variations with regard to which kinds of adjectives can extract, and whether they can always extract varied contexts. For example, Russian and BCS speakers seemed more accepting of some

LBE'd tokens if the person pronouncing them was annoyed or correcting (although the questionnaire results on the role of emotivity were inconclusive). That speaker effect is in some way operative seems evident because of the frequency with which this factor was mentioned by the consultants and questionnaire respondents. However, a better instrument would need to be developed in order to more precisely define the nature of that effect and whether it can be said to be a common factor for LBE across all article-less Slavic languages.

Support for or against DP in Slavic is not settled by the evidence related to LBE revealed in this study. However, it is possible to use expanded DP to account for some of the features of LBE operating within DP, if DP is assumed to be a phase edge. On the other hand, the parameterized DP, for which LBE is offered as the main evidence, is not widely acceptable as seen in the rarity of LBE in a language like Czech. The similarity of LBE to the process of splitting nominals, moreover, makes interpreting LBE as akin to split nominals fit into the DP-as-phase, expanded DP structure view for Slavic nominals. For their part, split nominals appear to be more widely attested in other Slavic languages while at the same time they are not seen in BCS. More basic questions should be answered before such conjectures can be verified. Corpus study of transcribed oral texts may be one avenue to pursue to uncover possible discourse contexts for LBE forms. Cross comparison among Slavic languages can then be conducted with the results of corpus studies to give a clearer picture of the relative frequency of LBE by language. Determining frequency may help support observations such as the tendency, seen in Czech, for speakers to use demonstratives rather than LBE, even when LBE is syntactically possible. Such corpus research could allow further LBE scholarship to allow

a typological analysis within Slavic that would help uncover both the potential underlying nominal structure and syntactic processes within which LBE occurs.

APPENDICES

APPENDIX A
QUESTIONNAIRE I: ADJECTIVE CATEGORIES
AND SPECIFICATIONAL FOCUS

A.1 English

SCENARIO I: Intersective Adjective

You and your friends Masha and Daria are out shopping. Masha needs to buy a dress. She has tried on a red dress, a green dress and a black dress. You realize that you were supposed to pick up your sister from school and have to leave while they're still shopping. Later in the evening, you are talking to Daria on the phone and ask her which dress Masha decided on.

(1) (Green) + (she bought) + (dress).

("she" should be placed wherever it sounds the most natural or omitted if that sounds best – same for pronouns in all the following sentences)

1	2	3	4
not grammatical	marginally grammatical	somewhat grammatical	perfectly grammatical

SCENARIO II: Subjective Adjective

Imagine that you are in charge of hiring a workman to help with repairs on the ceilings in your building. You have two candidates. Sasha is a short but very strong man. Vanya is not as strong but he is very tall. You think about which kind of man, a tall one or a very strong one would be good for the job. You tell your boss about Sasha and Vanya and ask which one you should hire. And your boss says:

(2) (Tall) + (I prefer) + (man).

1	2	3	4
not grammatical	marginally grammatical	somewhat grammatical	perfectly grammatical

SCENARIO III: Modal Adjective

You are watching the news with your mother and there is a report about a burglary. The police questioned two men. The police are certain that one of the men was the actual

thief. You tell your mother that one of the men is related to your friend Katya. Your mother asks you which of the men is she related to, the real thief or the alleged thief.

(3) (Alleged) + (she knew) + (thief). He is her uncle.

1	2	3	4
not grammatical		marginally grammatical	somewhat grammatical perfectly grammatical

SCENARIO IV: Verbal Privative Adjective

Olga works for the local transportation committee. One of her jobs is to meet with the regional chairman once a month to give him a report on the development projects in her region. She then gives you the report with his signature so that you can file it. You know that there is supposed to be a new regional chairman, but you don't know if, in her last meeting, Olga met the former chairman or the current one. You ask her and she answers:

(4) (Former) + (I met) + (chairman)

1	2	3	4
not grammatical		marginally grammatical	somewhat grammatical perfectly grammatical

SCENARIO V: Nominal Privative Adjective

Andrei works in airport security. When international travelers arrive, they must first stop at Passport Control, where Andrei works. He told his wife that one time a famous actor was stopped because they thought his passport was fake. Because the actor was so well-known, Andrei said they found the actor carrying two passports. "And which passport do you think he showed to the officials?" He went on to answer his own question by saying:

(5) (Fake) + (he presented) + (passport).

1	2	3	4
not grammatical		marginally grammatical	somewhat grammatical perfectly grammatical

(If this scenario sounds too odd, I have a different one which focuses on the adjective "false" that can be substituted)

SCENARIO VI: Distal Demonstrative Pronoun

You are given a choice between two pens. The salesman presents them to you saying: Do you want this pen or that pen. You answer:

(6) (That) + (I want) + (pen).

1	2	3	4
---	---	---	---

not grammatical marginally grammatical somewhat grammatical perfectly grammatical

SCENARIO VII: Proximal Demonstrative Pronoun

You and your friend are going to buy a chair for your apartment. Your friend decides which of the two chairs he will buy. Showing the chair answer to your mother later, you say you have many choices but:

(7) (This) + (he bought) + (chair).

1	2	3	4
not grammatical		marginally grammatical	somewhat grammatical perfectly grammatical

SCENARIO VIII: Possessive

Yulia, Asya, and Petya are going to study together. When Yulia calls Asya before they meet, Asya asks if she should bring her textbook or if Petya should bring his. Yulia says:

(8) (Yours) + (I need) + (book).

1	2	3	4
not grammatical		marginally grammatical	somewhat grammatical perfectly grammatical

Anketa

Kako ovaj redosled reči odgovara opisanoj situaciji?

Scenario I

Vi i Vaše prijateljice Maša i Jovana ste u kupovini. Maša treba da kupi haljinu. Proba crvenu, zelenu i crnu haljinu. Iznenada, Vi shvatate da je trebalo da kupite svoju sestru iz škole i da morate da odete dok one i dalje isprobavaju odeću. Kasnije te večeri, razgovarate sa Jovanom telefonom i pitate je za koju haljinu se Maša odlučila. Kako biste ocenili sledeću rečenicu, Jovani odgovor na Vaše pitanje?

(1) Zelenu je kupila haljinu.

neprirodno	1	2	3	4	prirodno

A.3 Czech

SCÉNÁŘ I.

Vy a vaše kamarádky Martina a Dana jste vyrazily nakupovat. Martina si potřebuje koupit šaty. Ozkoušela si červené šaty, zelené šaty a černé šaty. Najednou si uvědomíte, že jste měla vyzvednout svojí sestru ze školy, a tak odejdete, zatímco kamarádky ještě nakupují. Večer si voláte s Danou a ptáte se, jaké šaty si nakonec Martina vybrala.

Jak byste posoudili následující větu, kterou Dana odpovídá na vaši otázku:

(1) Zelené šaty si koupila.

Vám připadá:

1	2	3	4
gramaticky špatný	gramaticky ucházející	gramaticky celkem v pořádku	gramaticky perfektní

SCÉNÁŘ II.

Představte si, že vás váš nadřízený pověřil najmutím pracovníka na opravu stropů ve vaší budově. Máte dva kandidáty. Saša je malý, ale velmi silný. Václav není tak silný, ale je hodně vysoký. Přemýšlíte, který z nich by byl lepší. Nadřízenému je popíšete a ptáte se ho, kterého z nich máte najmout.

Jak byste posoudili následující větu, kterou vám váš nadřízený odpovídá na vaši otázku:

(2) Vysokého preferuji chlapíka.

Vám připadá:

SCÉNÁŘ III.

Ve zprávách, na které se díváte spolu s vaší matkou, mluví o vloupání. Policisté vyslechli dva muže a jsou jistí, že jeden z nich je zloděj, který má vloupání na svědomí. Vy říkáte matce, že jeden z těch dvou mužů je příbuzný vaší kamarádky Katky. Vaše matka chce vědět, kterého z těch dvou mužů Katka zná – toho domnělého anebo toho opravdového zloděje?

Jak byste posoudili následující větu, kterou matce odpovíte:

(3) Domnělého zná zloděje. Je to její strejda.

Vám připadá:

1	2	3	4
gramaticky špatný	gramaticky ucházející	gramaticky celkem v pořádku	gramaticky perfektní

SCÉNÁŘ IV.

Olga pracuje pro lokální úřad dopravy. Jednou z jejích povinností je sejít se jednou měsíčně s vedoucím dopravy všech regionů, a předat mu zprávu o projektech rozvoje. Po schůzce vám Olga dává zprávu s podpisem vedoucího na založení do složky. Vy víte, že původní vedoucí dopravy by měl být nahrazen novým, ale nevíte, jestli se při poslední schůzce Olga navštívila toho původního nebo toho nového. Zeptáte se jí a ona vám odpoví.

Jak byste posoudili následující větu, kterou vám Olga odpovídá:

(4) Původního jsem navštívila vedoucího.

Vám připadá:

1	2	3	4
gramaticky špatný	gramaticky ucházející	gramaticky celkem v pořádku	gramaticky perfektní

SCÉNÁŘ V.

Malý Petr a jeho kamarádi si rádi hrají na hřisti v domovním komplexu na policajty a zloděje. Nájemníci si často stěžují, že kluci dělají randál a jeden z nich také tvrdí, že Petr nosí na hřiště opravdovou pistoli. Vy jste členem výboru domovního komplexu a tak si musíte promluvit s Petrovou matkou a zjistit, jestli Petr nosí na hřiště pravou nebo falešnou zbraň. Zeptáte se jí, a ona vám odpoví.

Jak byste posoudili následující větu, kterou vám Petrova matka odpovídá:

(5) Falešnou Petr nosí pistoli.

Vám připadá:

APPENDIX B

QI DATA SUMMARY

B.1 BCS

Table B.1 Online Questionnaire Results

Written Responses

8 written responses were included. No one mentions irritation, surprise etc., as affecting acceptability

Interview

In discussion with the consultant:

Q: Do any of the tokens from the adjective-fronting questionnaire have different acceptability if you take into account the speaker's attitude. For example, if, in responding with any of the tokens, they are more likely to be said if the speaker is surprised or doubtful or annoyed (mostly negative attitudes).

A:

No, I wouldn't say that the use I related to negativity for me, just to contrast with some other existing alternative (so perhaps surprise plays into it sometimes, but I wouldn't say it's necessary).

Also, it's more frequent for corrective focus, I would say, e.g.

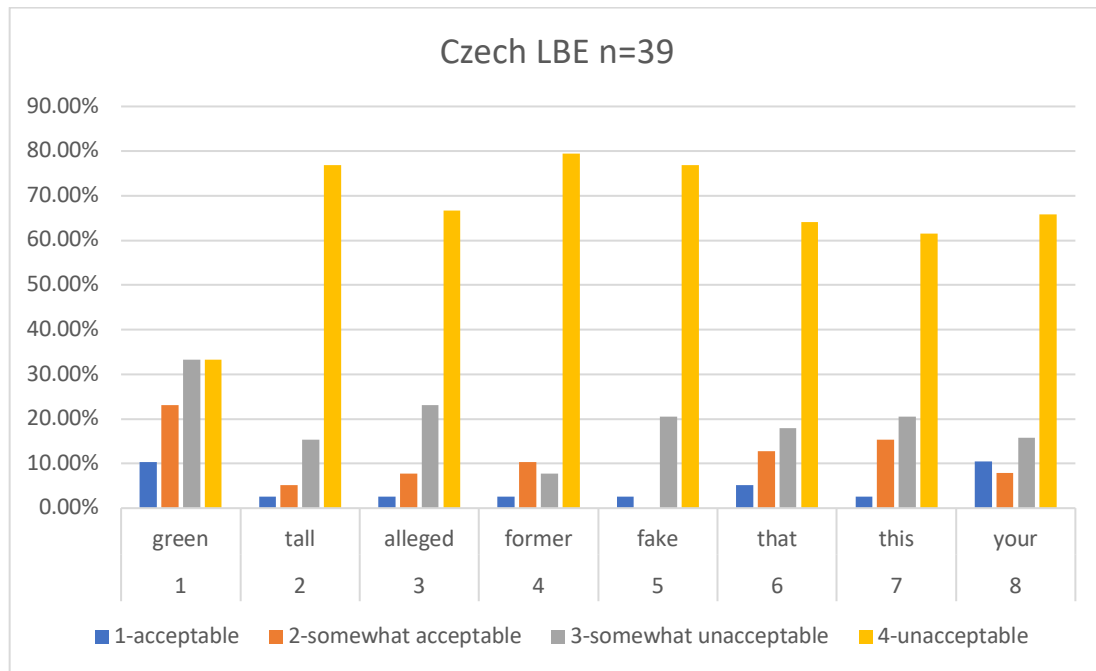

A: Mirjana je kupila zelenu haljinu.

Mirjana aux bought green dress

B: Nij-e. Plavu je kupila haljinu.
not-aux. blue aux bought dress

B.2 Czech

Table B.2 Online Questionnaire Results

Written Responses

13 written responses were included. Of those, no one mentions emotional shading affecting acceptability.

Interview

In discussion with the consultant:

Q: Are there any situations or attitudes that could make any of these sentences more acceptable?

A: It would be possible to use the sentences (answers) with this “wrong” word order but only if we put a demonstrative pronoun in front of the object.

For example:

"Ty zelene saty si koupila".
[this green dress AUX bought]

or

"Tu tvoji knihu potrebuji."

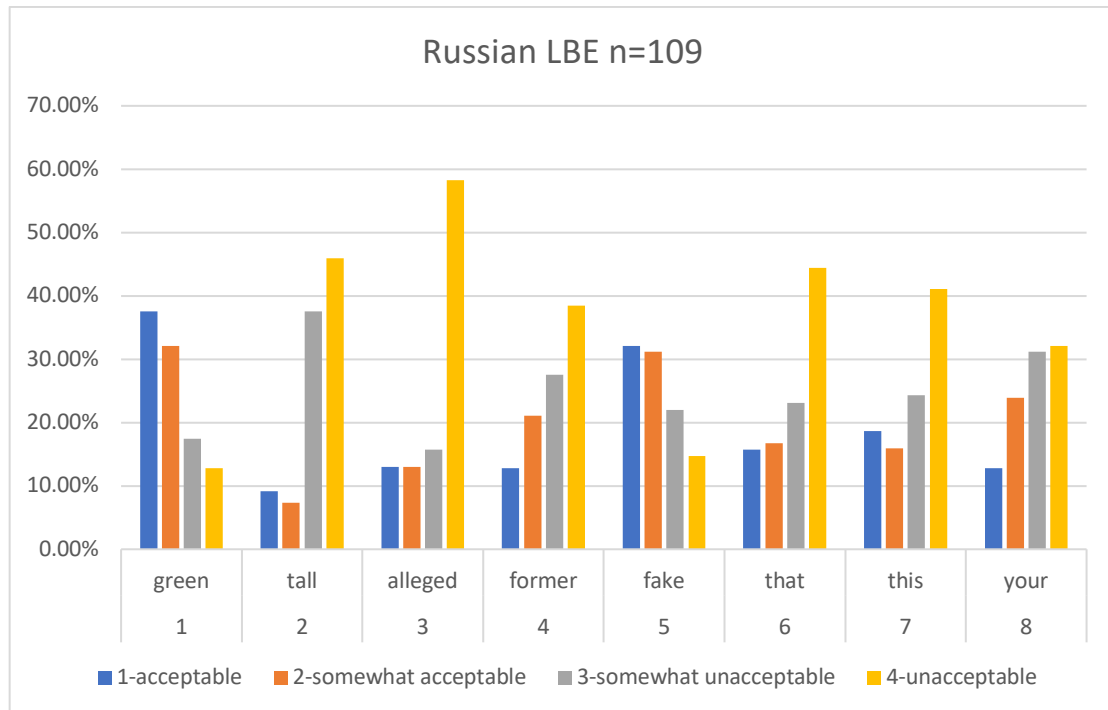

[that your book need]

If the sentence is structured like that, it can:

1. show an annoyance of the speaker - the person who is asking the question should already know the answer
2. mean that the speaker wants to emphasize the information which comes first in the sentence

B.3 Russian

Table B.3 Online Questionnaire Results

Written Responses

44 comments included in survey. Of those, 14 mention irritation or surprise making the forms more acceptable.

Interview

In discussion with the consultant

Q: Does the mood of the speaker have any effect on the acceptability of the given sentences? That is, is it easier to judge these examples as grammatical if the speaker has feelings of surprise, anger or annoyance (or similar emotions)?

A:

Scenario 1: With this word order, the stress will fall on “green”. It is possible then for there to exist an element of irritation or disagreement. These would be emotions toward

Masha (in which case it would be something like “This idiot bought a green dress, and she looks terrible in green”, or “which is of bad quality” or “which is very expensive” etc.) That is, Masha made the wrong choice. Or there could be a negative emotion toward us. Daria thinks that we are expressing too much curiosity and importunity.

Scenario 2: I don’t feel any kind of emotional coloring in this phrase. I do note that the words “to prefer” and “person”, seem to fit poorly together.

In real life, it would be more natural to say “Better the tall one to hire” or “The tall one better to hire” or “To hire the tall one is better”. In that last case the stress would fall on the last word (“better”). But even so, in none of these variants do I see any kind of emotional coloring.

Scenario 3: Here, to be honest, I don’t understand the thinking of the situation. The police are questioning two people who are under suspicion, only one of which is the thief, but the police still don’t know which one it is. But for some reason I know that the actual thief is not Katya’s relative? Therefore, the word “alleged” doesn’t really go with the scenario even in the spoken language. But, if we put this aside (the phrase as a whole is acceptable and completely correct), then the expression “Alleged she knows thief. He is her uncle” is possible (with) the existence of a little annoyance in relation to the mother, who “doesn’t know”. But this is not very strong annoyance and there is no especial negativity.

Scenario 4: The emotional aspects of this expression in the given situation seems neutral to me in any allowable variation on the word order.

Scenario 5: Analogously, the emotional aspects of this expression in the given situation seems neutral to me in any allowable variation on the word order.

Scenario 6: This phrase can be understood as a bit aggressive, expressing annoyance towards the salesman, who (what an idiot!) doesn’t understand which kind of pen I need.

Scenario 7: This is neutral as far as the emotional aspect.

Scenario 8: Yes, there is a bit of emotional content here (it’s similar to what is there with the case of the pen salesman).

APPENDIX C

BULGARIAN DATA

Note on Bulgarian definite articles

-at nominative masculine definite article /-ija accusative masculine definite article

(Note both used “this” and not “that” for 6 and 7)

Interviews

In consultation with informants:

Question: Given this scenario (from Stojković) how would you judge each sentence?

Sara i Marija pijat kafe. V ūgŭla na stajata sa obuvkite na Marija. Sara zabeljazva edni červeni obuvki

‘Sara and Maria are drinking coffee. In the corner of the room are Maria’s shoes. Sara notices some red shoes.’

S: Obuvkite sa tvoj?
shoes.DEF are yours
‘Are those your shoes?’

M: Ne, ne, Ana gi kupi i zabravi tuk onija den.
no no Ana them bought and forgot here that day
‘No, no, Ana bought them and forgot them here the other day.’

S: Červenite kupi obuvki? Az ne gi haresvam
red.PL.DEF bought shoes I not them like
‘She bought red shoes? I don’t like them.’

Participant I

Answer:

S: **Tija** červenite obuvki, tvoi ili sa?
 these.PL.ACC red.PL.DEF shoes yours or hers
 ‘Are these red shoes yours or hers?’

M: Ne, ne. Na Ana sa, ama gi zabravja tuk onja
 den
 no no of Ana are but them forgot there that
 day

Ama gi zabravi
 but them forgot

‘No, no, they’re Ana’s, but she forgot them here the other day. But she forgot them.’

(Then I asked): Better with *tija*? (i.e. not just the adjective but the demonstrative + the adjective)

Answer:

S: **Tija** červenite li kupi? Na men ne mi
 haesvat
 these.PL.ACC red.PL.DEF INTERR. bought of me not me.DAT like
 ‘You bought these red ones? In my opinion I don’t like them’

That would be the most common way for people to say it. It is colloquial

Tezi červenite obuvki ili kupi?
 these.PL.NOM red.PL.DEF shoes or bought
 ‘You bought these red shoes?’

That is also fine. It’s just that we “eat” letters when we speak.

Q: Is it important that that sentence structure (Tija červenite li kupi) is used to say a negative opinion?

Answer: I think so but I am not a language expert. I would use that structure along with an intonation to express negative opinion.

Participant II

Sara’s first sentence sounds a little off.

Tezi obuvki tvoi li sa?
 these.PL.NOM shoes yours INTERR are
 ‘These shoes are yours?’

or

Tvoi li sa tezi obuvki
yours INTERR are these.PL.NOM shoes
'Are these your shoes?'

Maria's sentence sounds fine.

Sara's second sentence is totally off.

Kupi tezi červenite obuvki?
buy these.PL.NOM red.PL.DEF shoes
'She bought these red shoes?'

Tja kupi tezi červenite obuvki
she buy these.PL.NOM red.PL.DEF shoes
She bought these red shoes?

Tija červenite li kupi
these.PL.ACC red.PL.DEF INTERR buy
'These are the red shoes she bought?'

or if I have to have a question here, I'd say something like this:

Tja kupi červen obuvki? A ne gi haresvam
she buy red.PL shoes.PL but no them like
'She bought red shoes? I don't like them.'

Participant III

The most natural sounding sentence is what Maria says, after that, Sara's first sentence, but Sara's second sentence sounds very unnatural.

APPENDIX D

QUESTIONNAIRE II

D.1 BCS Version

Given the following scenarios, would it be possible for a person to respond with a sentence that uses the following word order:

accusative adjective + verb + accusative noun

Scenario 1: Verbal Privative Under Specificational Focus

Consider the adjective for “invented” (замишљени)

A teacher says she will discuss either a story someone has invented, a historical event or a current news story. She asks which one should be discussed first. You say you want to hear about the invented story. Can you use the word order:

Invented + tell me + story

Scenario 2: Nominal Privative Under Specificational Focus

Using the same scenario, can you use the adjective for “fictitious” (фиктивни) in place of “invented” (замишљени)?

Scenario 3: Verbal Privative Under Contrastive Focus

Consider the adjective for “former” (бивши)

You are debating politics and you want to talk about a policy whose wording was changed by a new law. The person you are talking to gets confused about which version of the policy you are discussing. You tell that person that you are talking about the former version of the law, not the current version. Can you use the word order:

About the former + I am talking + version

Scenario 4: Nominal Privative Under Contrastive Focus

Consider the adjective for “fake” (лажни)

You are working on a movie set and are responsible for the scenery. You have asked the workers to move some fake trees but to leave some potted, live trees where they are. One of the workers asks you which you wanted moved. Can you use the word order:

Fake + move + trees (not the live ones)

D.2 Czech Version

QUESTIONNAIRE II

Given the following scenarios, would it be possible for a person to respond with a sentence that uses the following word order:

accusative adjective + verb + accusative noun

Scenario 1: Verbal Privative Under Specificational Focus

Consider the adjective for “invented” (vymyšlený)

A teacher says she will discuss either a story someone has invented, a historical event or a current news story. She asks which one should be discussed first. You say you want to hear about the invented story. Can you use the word order:

Invented + tell me + story

Scenario 2: Nominal Privative Under Specificational Focus

Using the same scenario, can you use the adjective for “fictitious” (fiktivní) in place of “invented” (vymyšlený)?

Scenario 3 Verbal Privative Under Contrastive Focus

Consider the adjective for “former” (bývalý)

You are debating politics and you want to talk about a policy whose wording was changed by a new law. The person you are talking to gets confused about which version of the policy you are discussing. You tell that person that you are talking about the former version of the law, not the current version. Can you use the word order:

About the former + I am talking + version

Scenario 4: Nominal Privative Under Contrastive Focus

Consider the adjective for “fake” (falešný)

You are working on a movie set and are responsible for the scenery. You have asked the workers to move some fake trees but to leave some potted, live trees where they are. One of the workers asks you which you wanted moved. Can you use the word order:

Fake + move + trees (not the live ones)

D.3 Russian

АНКЕТА II

В данных сценарий, можно ответить с предложением типа:

Прилагательное + глагол + существительное, (которому принадлежит прилагательное)

Сценарий 1: Verbal Privative Under Specificational Focus

Прилагательное (англ. “invented”): выдуманный

Преподаватель объясняет, что обсудит или выдуманный рассказ, или историческое событие, или сегодняшнее событие от новостей. Она спрашивает, какой тип истории предпочитаете обсудить. А вы ответите, что хотите обсудить выдуманный рассказ. Можно употребить следующий порядок слов?

A teacher says she will discuss either a story someone has invented, a historical event or a current news story. She asks which one should be discussed first. You say you want to hear about the invented story. Can you use the word order:

Выдуманный расскажите мне рассказ

Сценарий 2: Nominal Privative Under Specificational Focus

В том же сценарии (Сценарий 1), можно пользоваться прилагательным: «фиктивный» (англ. “fictitious”) вместо прилагательного «выдуманный»?

Сценарий 3: Verbal Privative Under Contrastive Focus

Прилагательное (англ. “former”) бывший

Вы обсуждаете политики и хотите говорить о законе, в который недавно были внесены поправки. Собеседник запутается какую версию закона, что вы имеете в виду. Вы объясните, что вы о бывшей версии говорите, а не о последней версии. Можно употребить следующий порядок слов?

You are debating politics and you want to talk about a policy whose wording was changed by a new law. The person you are talking to gets confused about which version of the policy you are discussing. You tell that person that you are talking about the former version of the law, not the current version. Can you use the word order:

О бывшей говорю версии

Scenario 4: Nominal Privative Under Contrastive Focus

Прилагательное (англ. “fake”) искусственный

Вы сценарист фильма. Когда работаете над съемочной площадкой, вы говорите рабочим, что им переместить несколько искусственных деревьев, а оставить живые на месте. Один из рабочих спросит, какой тип дерева они должны переставить

You are a scenarist for a film. When you are working on the set, you tell the workers to move several fake trees but leave the living trees alone. One of the workers asks you which you wanted moved. Can you use the word order:

Искусственные переместите деревья (а не живые)

APPENDIX E

QUESTIONNAIRE III

DRAFT

Below there are nine sample sentences with the word order: adjective + predicate + noun.

Following each sample sentence there are four numbered situations/questions.

A. Using the following scale, please indicate whether or not you think the sample sentence would be appropriate to say in that given situation or as an answer to that question:

- 1 – yes I could use this sentence with this scenario/question
- 2— I could use it, but it sounds strange (#)
- 3 – I would not use this sentence with this scenario/question (*)

B. If you had to imagine a scenario where you'd be most likely to use that word order, how would you describe that scenario?

I. Intersective Adjective

For each of the given contexts and questions concerning Mary and the speaker, how would you rate using the following sentence? (REFINE THIS)

green + she bought + dress

A.

1) Mary bought the green dress and I bought the blue dress

1 2 3

2) Mary bought the blue dress?

1 2 3

3) Which dress did Mary buy? The green dress or the blue dress?

1 2 3

4) In the store was a green dress. The green dress....[CAREFUL ABOUT CONTEXTUALIZATION probably needs a different type of set up than this]

1 2 3

B.

Describe a scenario:

II. Subjective Adjective

beautiful + he built + house

A.

- 1) He built a beautiful house but John built an ugly one
1 2 3
- 2) He built an ugly house?
1 2 3
- 3) There are two houses here, an ugly one and a beautiful one. Which one did he build?
1 2 3
- 4) He spent several years building a house. The house he built was beautiful.
1 2 3

B.

Describe a scenario:

III. Privative (verbal) Adjective

former + I was talking to + president

A.

- 1) I talked to the former president but Mary talked to the current president
1 2 3
- 2) I was talking to the current president?
1 2 3
- 3) Who were you talking to?
1 2 3
- 4) There was a man at the table. He was the former president of the company.
1 2 3

B.

Describe a scenario:

IV. Privative (nom) Adjective

fake + the bride carried + flowers

A.

- 1) The bride carried fake flowers whereas I had fresh ones.

- 1 2 3
2) Did she carry fresh flowers?
1 2 3
3) What kind of flowers did the bride use?
1 2 3
4) The bride was very particular about her allergies when she decided on flowers for the ceremony. She carried fake flowers.
1 2 3

V. Modal (verbal) Adjective

alleged + he knew + murderer

A.

- 1) He only knew an alleged murderer, but I knew an actual murderer
1 2 3
2) Did he know an actual murderer?
1 2 3
3) What kind of murderer did he know?
1 2 3
4) The police lined up all the suspects for the witness. It was the alleged murderer that he knew.
1 2 3

B.

Describe a scenario:

VI. Modal (nom) Adjective

potential + he met + employee

A.

- 1) He met a potential employee, while I was talking to current employees
1 2 3
2) Did he meet a current employee?
1 2 3
3) Of all possible kinds of people, what kind of person was he meeting?
1 2 3
4) I found someone I thought he might want to hire. Today he met the potential employee
1 2 3

B.

Describe a scenario:

VII. Demonstrative

a. (proximal)

this + I used + pen

A.

1) I used this pen, but I didn't use that pen

1 2 3

2) Do you use that pen?

1 2 3

3) Of all these pens, which pen did you use?

1 2 3

4) ???

1 2 3

B.

Describe a scenario:

b. (distal)

that + I bought + chair

A.

1) I bought that chair, but I wanted this chair.

1 2 3

2) Did you want this chair?

1 2 3

3) Of all these chairs, which of these chairs did you want?

1 2 3

4) ??? I went to the store and saw a chair. I bought that chair.

B.

Describe a scenario:

VIII. Possessive

your + I need + book

A.

1) I need your book, but Mary needs Peter's book

1 2 3

2) Did you need Peter's book?

1 2 3

3) Of all these books, which book did you need?

1 2 3

4) ???I know I need to use a book for the homework. I need your book.

1 2 3

B.

Describe a scenario:

APPENDIX F

QUESTIONNAIRE IV

F.1 English Version

Questionnaire IV

Below there are six scenarios. For each scenario, you are asked to judge how well the sample sentence would fit in that context.

Using the following scale, please indicate whether or not you think the sample sentence would be appropriate to say in that given situation:

- 1 – Yes, I could use this sentence with this scenario.
- 2— I could use it, but it sounds strange.
- 3 – I would not use this sentence with this scenario.

Scenario Ia: Neutral for Specificational Focus

You and your friends Masha and Daria are at Masha's house. You are helping Masha decide what to wear to a fancy party she's been invited to. She has tried on a red dress, a green dress, a black dress, and two pantsuits. Daria realizes that she was supposed to pick up her sister from school and has to leave while Masha is still deciding. The next day you are talking to Daria on the phone and she asks which outfit Masha ended up wearing to the party.

You reply:

green + she wore + dress

- 1 – Yes, I could use this sentence with this scenario.
- 2— I could use it, but it sounds strange.
- 3 – I would not use this sentence with this scenario.

Scenario Ib: Emotive for Specificational Focus

You and your friends Masha and Daria are at Masha's house. You are helping Masha decide what to wear to a fancy party she's been invited to. She has tried on a red dress, a green dress, a black dress and two pantsuits. Daria says she can't wait any longer and has to go to another appointment, and she leaves. The next day Daria calls to ask which outfit Masha ended up wearing to the party. You thought the red dress was the best choice, but Masha picked the green one, which you thought was unattractive and fit her poorly. In this context, you reply:

green + she wore + dress

- 1 – Yes, I could use this sentence with this scenario.
- 2— I could use it, but it sounds strange.
- 3 – I would not use this sentence with this scenario.

Scenario IIa: Neutral for Corrective Focus

You return home from work and realize you left your briefcase at the kiosk in the lobby of your office building. You call the building manager to find out if anyone turned it in. The manager asks if the person at the kiosk when you left the briefcase was a woman wearing a yellow dress. You explain that it was a woman in a green dress, not a yellow dress.

green + she wore + dress

- 1 – yes I could use this sentence with this scenario
- 2— I could use it, but it sounds strange (#)
- 3 – I would not use this sentence with this scenario (*)

Scenario IIb: Emotive for Corrective Focus

You return home from work and realize you left your briefcase at the kiosk in the lobby of your office building. You call the building manager to find out if anyone turned it in. The manager says he doesn't know if it was turned in. You ask him if he can ask the woman working at the kiosk if she saw your briefcase. Finally, the manager asks "Do you mean the woman in the yellow dress?" However, you remember that the woman working at the kiosk was wearing a hideous-looking green dress. In this context, can you say:

green + she wore + dress

- 1 – Yes, I could use this sentence with this scenario.
- 2— I could use it, but it sounds strange.
- 3 – I would not use this sentence with this scenario.

Scenario IIIa: Neutral for Contrastive Focus

Your daughter goes to a friend's house to play. The friend wants to do a pretend fashion show and tells your daughter to wear a blue dress. But your daughter wants to wear a green dress because she thinks it is prettier. She ends up going to the friend's house wearing the green dress, not the blue one. In this context can you say to the friend:

green + she wore + dress

- 1 – Yes, I could use this sentence with this scenario.
- 2— I could use it, but it sounds strange.

3 – I would not use this sentence with this scenario.

Scenario IIIb: Emotive for Contrastive Focus

Your daughter goes to a friend's house to play. The friend wants to do a pretend fashion show and tells your daughter that for the show, all the outfits will be blue. But your daughter wants to wear a green dress because she thinks it is prettier. She ends up going to the friend's house wearing the green dress, not the blue one. You are concerned that the friend will not be happy with the green dress. In this context can you say to the friend:

green + she wore + dress

- 1 – Yes, I could use this sentence with this scenario.
- 2— I could use it, but it sounds strange.
- 3 – I would not use this sentence with this scenario.

F.2 BCS Version

Questionnaire IV

Ispod se nalaze 6 scenarija. Za svaki scenario, oceni koliko prikladno se rečenica uklapa u kontekst.

Koristeći ponudjenu skalu, oceni da li je ponudjena rečenica prikladna u datoj situaciji.

- 1 – Da, iskoristio bih ovu rečenicu.
- 2 – Može se iskoristiti, ali zvuči čudno.
- 3 – Nikada ne bih iskoristio ponudjenu rečenicu.

Scenario Ia

Ti i tvoje drugarice Masa i Daria ste kod Maše u kući. Pomažete Maši da odluči šta da obuče za “fensi” žurku na koju je pozvana. Probala je crvenu haljinu, zelenu haljinu, crnu haljinu i dva kombinezona. Daria shvata da treba da pokupi sestru iz škole i mora da ostavi Mašu da sama donese odluku. Sledećeg dana pričaš sa Dariom telefonom i ona te pita koju je haljinu Maša odlučila da nosi na žurci.

Ti odgovaraš:

Zelenu

- 1.) Da, iskoristio bih ovu rečenicu.
 - a. ____ Yes, I would say this.

Kad biš samo rekao „zelenu“, a neko te je pitao o čemu govoriš, koju biš punu rečenicu dao umesto „zelenu“?

- b. ____ Nikada ne bih iskoristio ponudjenu rečenicu.

Koji odgovor bi zvučao najprirodnije u ovoj konverzaciji?

Scenario Ib

Ti i tvoje drugarice Maša i Daria ste kod Maše kod kuće. Pomažete Maši da odluči sta da obuče za “fensi” žurku na koju je pozvana. Probala je crvenu haljinu, zelenu haljinu, crnu haljinu i dva kombinezona. Daria kaže da ne može više da čeka i odlazi na sastanak. Sledećeg dana Daria zove da pita koju haljinu je Masa odlučila da nosi na žurci. Ti misliš da je crvena haljina najbolji izbor, ali Maša je odabrala zelenu za koju si ti mislio/la da joj ne stoji dobro. U ovom kontekstu tvoj odgovor je:

Zelenu je nosila haljinu!

- 2.)
- a. ____ Da, iskoristio bih ovu rečenicu.
- b. ____ Nikada ne bih iskoristio ponudjenu rečenicu.

Koji odgovor bi zvučao najprirodnije u ovoj konverzaciji?

Scenario IIa

Vraćaš se sa posla i shvataš da si ostavio torbu na kiosku u predvorju svoje firme. Zoveš menadžera da proveriš da li je iko pronašao torbu. Menadžer pita da li je osoba koja radi na kiosku kada si ostavio torbu bila žena koja nosi žutu haljinu. Ti objašnjavaš da je žena nosila zelenu, a ne žutu haljinu.

Zelenu je nosila haljinu.

- 3.)
- a. ____ Da, iskoristio bih ovu rečenicu.
- b. ____ Može se iskoristiti, ali zvuci čudno
- c. ____ Nikada ne bih iskoristio ponudjenu rečenicu.

Koji odgovor bi zvučao najprirodnije u ovoj konverzaciji?

Scenario IIb

Vraćaš se sa posla i shvatas da si ostavio torbu na kiosku u predvorju svoje firme. Zoveš menadžera da proveriš da li je iko pronašao torbu. Menadžer kaže da ne zna da li je torba pronadjena. Pitaš ga da li može da pita ženu koja radi na kiosku da li je ona videla tvoju torbu. Konačno, menadžer pita: „Da li misliš na ženu u žutoj haljini?” Medjutim, sećaš se da je žena koja je radila na kisoku nosila odvratnu zelenu haljinu. U ovom kontekstu, možeš li reći:

Ne, ne, zelenu je nosila haljinu.

4.)

- a. ☐ Da, iskoristio bih ovu rečenicu.
- b. ☐ Može se iskoristiti, ali zvuci čudno
- c. ☐ Nikada ne bih iskoristio punudjenu rečenicu.

Koji odgovor bi zvučao najprirodnije u ovoj konverzaciji?

Scenario IIIa

Tvoja ćerka ide kod drugarice kući da se igra. Drugarica želi da se igra modne revije i kaže tvojoj ćerki da obuče plavu haljinu. Ali tvoja ćerka želi da obuče zelenu haljinu jer joj se više sviđa. Na kraju odlazi kod drugarice u zelenoj haljini, ne u plavoj. U ovom kontekstu možeš li reći drugarici:

Zelenu je nosila haljinu.

5.)

- a. ☐ Da, iskoristio bih ovu rečenicu.
- b. ☐ Može se iskoristiti, ali zvuci čudno
- c. ☐ Nikada ne bih iskoristio punudjenu rečenicu.

Koji odgovor bi zvučao najprirodnije u ovoj konverzaciji?

Scenario IIIb

Tvoja ćerka ide kod drugarice kući da se igra. Drugarica želi da se igra modne revije i kaže tvojoj ćerki za reviju, svi treba da nose plavo. Ali tvoja ćerka želi da nosi zelenu jer joj se više sviđa. Na kraju odlazi kod drugarice u zelenoj haljini, ne u plavoj. Ti si

zabrinut da drugarica neće biti srećna kad je vidi u zelenoj haljini. U ovom kontekstu možeš li reći drugarici:

Zelenu je nosila haljinu.

- 6.)
- a. ☐ Da, iskoristio bih ovu rečenicu.
 - b. ☐ Može se iskoristiti, ali zvuči čudno
 - c. ☐ Nikada ne bih iskoristio ponudjenu rečenicu.

Koji odgovor bi zvučao najprirodnije u ovoj konverzaciji?

F.3 Czech Version

Dotazník IV

Níže je uvedeno šest situací. U každé situace posuďte, jak dobře zapadá vzorová věta do kontextu. Vyberte vždy jednu z možností uvedených pod vzorovou větou.

Situace Ia

Vy a vaše kamarádky Míša a Dana jste doma u Míši. Pomáháte Míše vybrat šaty na důležitý večírek. Míša si ozkoušela červené šaty, zelené šaty, černé šaty a dva kalhotové kostýmy. Najednou si Dana uvědomí, že slíbila vyzvednout ze školy svou mladší sestru, a i když se Míša ještě nerozhodla, které šaty si vezme na sebe, Dana musí odejít. Následující den mluvíte s Danou, a ta se ptá, jaké šaty si nakonec Míša vzala. Vy odpovíte:

QIVa: *ty zelené si vzala*

QIVb: *ty zelené si vzala*

- 1.)
- a. ☐ Ano, tuto větu bych řekl/a.

Kdyby jste odpověděli “Ty zelené si vzala” a někdo se vás zeptal, o čem mluvíte, jak by zněla celá věta místo zkrácené odpovědi “*Ty zelené si vzala?*”

- b. ☐ Ne, v této situaci bych tuto větu nepoužil/a.

Jaká by byla podle vás nejpřirozenější odpověď na tuto otázku v rámci uvedené konverzace?

Situace Ib

Vy a vaše kamarádky Míša a Dana jste doma u Míši. Pomáháte Míše vybrat šaty na důležitý večírek. Míša si ozkoušela červené šaty, zelené šaty, černé šaty a dva kalhotové kostýmy. Najednou si Dana uvědomí, že slíbila vyzvednout ze školy svou mladší sestru, a i když se Míša ještě nerozhodla, které šaty by byly nejlepší, Dana musí odejít. Následující den mluvíte s Danou, a ta se ptá, jaké šaty si nakonec Míša vzala na sebe. Vy si myslíte, že červené šaty by byly nejlepší, ale Míša si vybrala ty zelené, o kterých si vy myslíte, že nebyly hezké a ani jí neslušely. Na základě tohoto kontextu odpovězte:

QIVa: *ty zelené si vzala*

QIVb: *ty zelené si vzala*

2.)

- a. ☐ Ano, takhle bych mohl/a odpovědět.
- b. ☐ Takhle bych mohl/a odpovědět, ale zní to divně.
- c. ☐ Ne, v tomto kontextu bych nepoužil/a takto konstruovanou větu.

Jaká by byla podle vás nejpřirozenější odpověď na tuto otázku v rámci uvedené konverzace?

Situace IIa

Po návratu z práce domů jste si uvědomili, že jste na recepci firmy, kde pracujete, zapoměli tašku. Zavoláte správci budovy a ptáte se, jestli tašku někdo našel a vrátil. Správce se vás ptá, jestli v době, kdy jste tam tašku zapoměli, byla na recepci jako recepční žena ve žlutých šatech.

Vy vysvětľujete, že recepční na sobě neměla žluté šaty, ale zelené.

QIVa: *zelené měla šaty*

QIVb: *zelené měla*

3.)

- a. ☐ Ano, takhle bych mohl/a odpovědět.
- b. ☐ Takhle bych mohl/a odpovědět, ale zní to divně.
- c. ☐ Ne, v tomto kontextu bych nepoužil/a takto konstruovanou větu.

Jaká by byla podle vás nejpřirozenější odpověď na tuto otázku v rámci uvedené konverzace?

Situace IIb

Po návratu z práce domů jste si uvědomili, že jste na recepci firmy, kde pracujete, zapoměli tašku. Zavoláte správci budovy a ptáte se, jestli tašku někdo našel a vrátil. Správce vám odpoví, že neví. Vy se ho žádáte, aby se zeptal ženy, která v té době pracovala na recepci, jestli neviděla vaši tašku. Správce se vás ptá: “Myslíte tu ženu ve žlutých šatech?” Vy si ale pamatujete, že žena na recepci měla na sobě brčálově zelené šaty. Na základě tohoto kontextu odpovíte:

QIVa: *zelené měla šaty na sobě*

QIVb: *zelené měla na sobě*

4.)

- a. ☐ Ano, takhle bych mohl/a odpovědět.
- b. ☐ Takhle bych mohl/a odpovědět, ale zní to divně.
- c. ☐ Ne, v tomto kontextu bych nepoužil/a takto konstruovanou větu.

Jaká by byla podle vás nejpřirozenější odpověď na tuto otázku v rámci uvedené konverzace?

Situace IIIa

Vaše dcera si jde hrát ke svojí kamarádce. Kamarádka si chce hrát na modní přehlídku a poprosí vaši dceru, aby si vzala ty pěkné modré šaty. Vaše dcera si ale chce vzít zelené šaty, protože si myslí, že jsou hezčí. Nakonec si opravdu vezme ty zelené šaty, ne ty modré. Na základě tohoto kontextu řeknete její kamarádce:

QIVa: *ty zelené si vzala šaty*

QIVb: *ty zelené si vzala*

5.)

- a. ☐ Ano, takhle bych mohl/a odpovědět.
- b. ☐ Takhle bych mohl/a odpovědět, ale zní to divně.
- c. ☐ Ne, v tomto kontextu bych nepoužil/a takto konstruovanou větu.

Jaká by byla podle vás nejpřirozenější odpověď na tuto otázku v rámci uvedené konverzace?

Situace IIIb

Vaše dcera si jde hrát ke svojí kamarádce. Kamarádka si chce hrát na modní přehlídku a řekne vaší dceři, že na modní přehlídce budou všechny šaty modré. Vaše dcera si ale chce vzít zelené šaty, protože si myslí, že jsou hezčí. Nakonec si opravdu místo modrých šatů vezme ty zelené. Vy máte pocit, že její kamarádka nebude mít z těch zelených šatů radost. Na základě tohoto kontextu řeknete její kamarádce:

QIVa: *ty zelené si vzala šaty*

QIVb: *ty zelené si vzala*

6.)

- a. ____ Ano, takhle bych mohl/a odpovědět.
- b. ____ Takhle bych mohl/a odpovědět, ale zní to divně.
- c. ____ Ne, v tomto kontextu bych nepoužil/a takto konstruovanou větu.

Jaká by byla podle vás nejpřirozenější odpověď na tuto otázku v rámci uvedené konverzace?

F.4 Russian Version

Анкета IV

В этой анкете приведены шесть сценариев жизненных ситуаций, в которых фигурирует «зелёное платье». Пожалуйста, выберите и/или напишите свой вариант предложений, которые лучше передают информацию о «зелёном платье» и максимально согласуются с каждым сценарием

Сценарий Ia

Подруги выбирали платье для Татьяны. Одной из подруг пришлось быстро уйти, и она не узнала, какое платье было выбрано. Она позвонила позже и спросила, какое платье купила Татьяна. Та ответила:

Зеленое я купила платье

1.)

- a. ____ Да, я бы сказал это предложение в данным контексте.
- b. ____ Я бы предпочитал ответить просто: *Зеленое*

в. ____ Нет, нельзя так говорить в данном контексте.

Какое высказывание было бы более уместным (разговорным) в этом контексте?

Сценарий Iб

Подруги выбирали платье для Татьяны. Одной из подруг пришлось быстро уйти, и она не узнала, какое платье было выбрано. Татьяна, купившая зеленое платье знает, что этот цвет не нравится её подруге. Та позже позвонила и спросила, какое платье было куплено. Купившая зеленое платье Татьяна ответила раздраженно:

Зеленое я купила платье

2.)

а. ____ Да, это предложение уместно в данном контексте.

б. ____ Уместнее был бы ответ: *Зеленое*

в. ____ Нет, нельзя так говорить в данном контексте.

Какое высказывание было бы более разговорчивым в этом контексте?

Сценарий IIа

Вы были в магазине и на одном из прилавков забыли перчатки. Придя домой, вы позвонили управляющему этого магазина и спросили, не нашлись ли перчатки. Управляющий спросил: «Вы забыли перчатки рядом с той продавщицей, которая была в желтом платье?». Вы ответили:

В зеленом она была платье

3.)

а. ____ Да, я бы сказал это предложение в данном контексте.

б. ____ Я бы предпочитал ответить просто: *В зеленом*

в. ____ Нет, нельзя так говорить в данном контексте.

Какое высказывание было бы более разговорчивым в этом контексте?

Сценарий IIб

Вы были в магазине и на одном из прилавков забыли перчатки. Придя домой, вы позвонили управляющему этого магазина и спросили, не нашлись ли перчатки. Управляющий спросил: «Вы забыли перчатки рядом с той продавщицей, которая была одета в желтое платье?». Вы нетерпеливо и зло ответили управляющему, которого считаете идиотом:

В зеленом она была платье

4.)

а. ____ Да, я бы сказал это предложение в данным контексте.

б. ____ Я бы предпочитал ответить просто: «*В зелёном*»

в. ____ Нет, нельзя так говорить в данным контексте.

Какое высказывание было бы более разговорчивым в этом контексте?

Сценарий IIIа

Некая Таня пришла на вечеринку в зелёном платье. Ваш близкий человек спросил Вас, в каком платье была Таня.

Расставьте, пожалуйста, следующие слова в той последовательности, которая наилучшим образом передаст объективную информацию:

1. Таня 2. Зеленом 3. Была 4. Платье 5. В

Сценарий IIIб

Вам почему-то очень не понравилось то, что некая Таня пришла на вечеринку в зелёном платье.

Вы с возмущением говорите об этом Вашему близкому человеку. Расставьте, пожалуйста, следующие слова в той последовательности, которая максимально полно выразит Ваше возмущение:

1. Таня 2. Зеленое 3. Одеда 4. Платье

APPENDIX I**QIV DATA****BCS**

Table I.1 BCS QIV Responses

Scenario Ia: Neutral for Specificational Focus		
Speaker	Would you use?	What would be the most natural way to say it?
#1	Yes	Odlučila je da nosi zelenu haljinu.
#2	Yes	Zelenu haljinu koju nam je juče pokazala.
#3	Yes	zelenu haljinu
Scenario Ib: Emotive for Specificational Focus		
#1	No	Zelenu
#2	No	Mogla bih da iskoristim tri opcije: 1) Nosila je ZELENU haljinu (pridev je pod fokusom) 2) ZELENU haljinu je nosila (opet pridev pod fokusom) 3) Ma onu ZELENU haljinu je nosila (opet fokus kod prideva) Najprirodnije mi zvuči (1) od onih koje sam sama ponudila, ali mogu i ostale varijante. Na skali iznad bih, inače, kliknula na "može da se iskoristi ali zvuči čudno" da postoji ta opcija. Pošto nr postoji, morala sam ovako da odgovorim.
#3	No	nosila je zelenu haljinu
Scenario IIa: Neutral for Corrective Focus		
#1	Yes, but odd	Zelenu haljinu je nosila.
#2	Yes, but odd	Nosila je ZELENU haljinu. Zelenu haljinu je nosila. Druga varijanta mi je malo prirodnija, ali su obe moguće.
#3	Yes, but odd	zelenu haljinu je nosila
Scenario IIb: Emotive for Corrective Focus		
#1	Yes, but odd	Zelenu haljinu je nosila.
#2	Yes	Zelenu haljinu je nosila.
#3	Yes, but odd	zelenu haljinu je nosila
Scenario IIIa: Neutral for Contrastive Focus		
#1	Yes, but odd	Nosila je zelenu haljinu.
#2	Yes, but odd	Ipak je obukla zelenu haljinu.
#3	Yes, but odd	nosila je zelenu haljinu
Scenario IIIb: Emotive for Contrastive Focus		
#1	Yes, but odd	Nosila je zelenu haljinu.
#2	No	Ipak je obukla zelenu haljinu.
#3	Yes	nosila je zelenu haljinu

Czech***QIVa***

Table I.2 Czech QIVa Responses

Scenario Ia: Neutral for Specificational Focus		
Speaker	Would you use?	What would be the most natural way to say it?
A #1	Yes	Míša si vzala ty zelené šaty.
#2	x	
#3	yes	Míša si vybrala zelené šaty.
B #1	x	Ona si vzala ty zelené šaty.
#2	No	Ty zelené.
#3	x	Ty zelené si vybrala.
Scenario Ib: Emotive for Specificational Focus		
#1	Yes	Vzala si ty zelené, ale mně se nelíbily a nesluší jí.
#2	Yes	Ale, ty zelené si vzala.
#3	Yes	Ty zelené šaty si vzala.
Scenario IIa: Neutral for Corrective Focus		
#1	Yes, but odd	Ne, žena neměla zelené, ale žluté šaty.
#2	No	Ne, měla zelené šaty.
#3	Yes, but odd	Šaty měla zelené.
Scenario IIb: Emotive for Corrective Focus		
#1	No	Ne, v zelených šatech.
#2	No	Ne, v brčálově zelených.
#3	Yes, but odd	Měla na sobě zelené šaty.
Scenario IIIa: Neutral for Contrastive Focus		
#1	No	Ne, ona si vzala ty zelené šaty.
#2	No	Vzala si ty zelené.
#3	No	Vzala si zelené šaty.
Scenario IIIb: Emotive for Contrastive Focus		
#1	Yes, but odd	Ona si vzala ty zelené šaty.
#2	No	Ale ona si vzala ty zelené šaty.
#3	No	Vzala si zelené šaty.

QIVb

Table I.3 Czech QIVb Responses

Scenario Ia: Neutral for Specificational Focus		
Speaker		
A #1		
#2	Yes	No že si vzala ty zelený šaty.
#3		
#4		
#5		Myslím, že česky správně je tvar: "Kdybyste"
B #1	No	Vzala si ty zelené.
#2	x	Ty zelený.
#3	No	nevím
#4	No	Vzala si ty zelené šaty.
#5	No	Zelené.
Scenario Ib: Emotive for Specificational Focus		

#1	Yes, but odd	Nakonec si vzala ty zelené.
#2	No	Vzala si ty zelený. (+ patřičně znechucený výraz k tomu)
#3	No	nakonec si vybralam ty zeleny
#4	No	Rozhodla se pro ty zelené šaty.
#5	Yes	Ty zelené.
Scenario IIa: Neutral for Corrective Focus		
#1	No	Měla na sobě zelené šaty.
#2	Yes	Ne, zelený.
#3	No	ne, mela zluty saty vole
#4	No	Paní recepční byla v zelených šatech ne ve žlutých.
#5	Yes, but odd	Ne, měla zelené. Ve slově "zapomněl" se píše mně.
Scenario IIb: Emotive for Corrective Focus		
#1	No	Ne, myslím tu, která na sobě měla zelené šaty.
#2	No	Ne, v zelených
#3	No	ne, myslím ty ve zlutých
#4	No	Myslím tu recepční v zelených šatech.
#5	No	Ne, v zelených šatech. V tomto kontextu má být "vaši tašku" s krátkým i.
Scenario IIIa: Neutral for Contrastive Focus		
#1	No	Vzala si ty zelené.
#2	Yes	Ale vzala si ty zelený.
#3	No	ne, stejně si vzala ty modry
#4	No	Nakonec si vzala zelené šaty, ve kterých se cítila lépe.
#5	Yes, but odd	Vzala si ty zelené. V tomto kontextu má být "vaši dceru" s krátkým i.
Scenario IIIb: Emotive for Contrastive Focus		
#1	Yes, but odd	Vzala si ty zelené.
#2	No	Ale vzala si zelený.
#3	No	stejně si vzala ty zeleny
#4	No	Nezlob směna ní, vzala si zelené šaty.
#5	No	Vzala si zelené.

Russian

Table I.4 Russian QIV Responses

Scenario Ia: Neutral for Specificational Focus		
Speaker	Would you use?	What would be the most natural way to say it?
#1	Yes	Зелёное я купила.
#2	Prefer just 'green'	Я купила зелёное платье
#3	Prefer just 'green'	Я выбрала зелёное платье.
#4	Prefer just 'green'	Зелёное
#5	Prefer just 'green'	Зелёное платье.
#6	Prefer just 'green'	Выбрали зелёное, его я и купила
#7	Prefer just 'green'	Платье? Зелёное!
Scenario Ib: Emotive for Specificational Focus		
#1	Yes	Я купила зелёное.
#2	Yes	х
#3	Prefer just 'green'	Я предпочла зелёное платье
#4	Prefer just 'green'	Зелёное
#5	х	Зелёное купила.
#6	Yes	Купила зелёное
#7	Yes	Ты будешь смеяться, но зелёное!
Scenario IIa: Neutral for Corrective Focus		
#1	Yes	Она была в зелёном.
#2	Yes	Нет, она была в зелёном
#3	х	Да-да, верно, в жёлтом платье.
#4	Yes	В зелёном она была платье.
#5	х	Нет, она была в зеленом.
#6	Yes	Нет! В зелёном
#7	No	Нет, она была в зелёном платье!
Scenario IIb: Emotive for Corrective Focus		
#1	Yes	Которая была в зелёном.
#2	Yes	Продавщица была в зелёном платье
#3		Господин N, какая разница, в каком платье была продавщица. Я забыл коричневые кожаные перчатки была продавщица, я забыл была продавщица...Я забыл свои коричневые(чёрные, серебристого цвета)
#4	Yes	В зелёном она была платье.
#5	Yes	Она была в зелёном.
#6	Yes	Да нет! В зелёном
#7	Yes	С чего Вы взяли?! Она была в зелёном платье!
Scenario IIIa: Neutral for Contrastive Focus		
#1	n/a	Она была в зелёном.
#2	n/a	Нет, она была в зелёном
#3	n/a	Да-да, верно, в жёлтом платье.
#4	n/a	В зелёном она была платье.
#5	n/a	Нет, она была в зеленом.
#6	n/a	Нет! В зелёном
#7	n/a	Нет, она была в зелёном платье!
Scenario IIIb: Emotive for Contrastive Focus		
A#1	n/a	Таня зелёное одела платье.
#2	n/a	Таня одела зелёное платье

#3	n/a	Таня одела зелёное платье, а оно ей, как корове седло.
#4	n/a	Таня зелёное платье надела.
#5	n/a	Таня надела зелёное платье.
#6	n/a	Таня зелёное платье одела (только не "одела", а "надела")
#7	n/a	Зелёное платье одела Таня!
B#1	n/a	Таня была в зелёном платье.
#2	n/a	Таня была в зелёном платье
#3	n/a	Таня была в зелёном платье
#4	n/a	Таня была в зелёном платье.
#5	n/a	Таня была в зелёном платье
#6	n/a	Таня была в зелёном платье
#7	n/a	Таня была в зелёном платье.
